Contrary to general belief, Mr. Huxley declared that records prove that the ratio of selling expense is considerably below that for a like amount of domestic business, the reasons being that calls by salesmen are less frequent and orders

average larger. Another advantage is that this business is for cash, either before or coincident with the shipment of the goods.

To properly conduct an export business, one man at least must know export, think export, sympathize with export and

realize what it means. There are three ways for the smaller concerns to build up an export business: (1) Utilize export commission houses in this country; (2) send a representative to make one trip and appoint local agents, or (3) cooperate with other houses in non-competing lines and maintain a joint organization. Of these, he considered the last the least desirable; the second the most so. Mr. Huxley discussed the price question, the matter of credits, and advised a careful and intelligent handling of these subjects. He told those of his hearers who have added an export business to consider it as a fixture, and on no account let anything interfere with it, whatever may be domestic trade conditions. He said:

We are bound sooner or later to be forced into foreign trade in spite of ourselves, and being so forced, it is the wise man who recognizes the advantages to be obtained, who realizes the benefits that must come to his domestic business, and who carefully, slowly and intelligently develops part of his business in foreign fields.

RUBBER GOODS IN OVERSEAS TRADE.

John B. Maus, export manager of The Fisk Rubber Co., Chicopee Falls, Massachusetts, told of the growing importance of the rubber industry, gave some account of the production and uses of this material, and to this added some statistics. Touching upon its rapidly increasing use on account of the war, he spoke of the opportunities of American rubber manufacturers to place their products in foreign countries. To properly do this, he told his hearers they must know geography, the customs of the people, the shipping facilities, the railway, highway and other developments to determine the possible markets, and he described some of the more important ones. The importance of properly protecting trade-marks, the necessity of using the native tongue of the country in all correspondence, catalogs and advertising matter, and the probability of being obliged to give long term credit were touched upon, and the great advance in banking facilities described. Mr. Maus recommended a broad system of commercial education of young men. In conclusion he said:

JOHN B. MAUS

The business world to-day is vitally interested in this problem, for no organization can succeed in a material degree whose workers are not efficient. The foundation of national prosperity clearly rests upon that result accomplished by its people to serve real purposes in sympathy with current industry, science and government. If we can encourage early, direct business training, the usefulness of the populace of our country will assure both trading power and wealth. Now is the time to make arrangements for after-war business, by a high standard of quality, an intelligent representation, and sufficient encouragement by the financial interest to permit a worldwide business.

A GERMAN CRUDE RUBBER RUSE THAT FAILED.

Some curious documents occasionally reach the British Prize Court. One letter from a Hamburg firm to branches in Japan, recently intercepted, discloses a subtle attempt to get much needed rubber and copper through the British blockade into Germany. The veiled instructions follow:

"We request you to inform us if you will be able to supply us with large quantities of very heavy copper and bronze vases, also animals. You can send us the roughest and most faulty examples. The animals must be massive, not hollow, and must have the appearance of curiosities. If you can ship 10 to 20 tons per month direct to Sweden as curiosities * * * we shall be glad if you could arrange to pack the cases with raw rubber so that the works of art should not suffer."

This is another example of the importance of rubber in war times and reflects the extreme measures adopted by the Germans to secure even the smallest supplies of this necessary material.

EDWARD H. HUXLEY.

News of the American Rubber Trade.

MEETING OF THE EAGLE-PICHER LEAD CO.

THE Eagle-Picher Lead Co. held the annual summer meeting of its Eastern sales force in New York City, from June 19 to 21. The business sessions were held at the new New York offices at 101 Park avenue. Besides the sales force, there were present O. S. Picher, president; R. W. Evans, vice president and general sales manager; John R. MacGregor, assistant general sales manager, and John B. Livingston, all from Chicago; Mr. Chatam, manager of the Pittsburgh branch; also Dr. Schaeffer, chief chemist of the company; W. E. Maston, manager of the Philadelphia branch, and M. H. Riley, manager of the Baltimore branch. The company's new plant at Newark, New Jersey, was visited, and the social activities included a banquet at the Café Des Beaux-Arts, presided over by President Picher.

This was one of the most successful meetings this organization has held and those in attendance numbered about thirty.

SUBSIDIARIES ELECT PRACTICALLY IDENTICAL OFFICERS.

The two leading subsidiaries of the United States Rubber Co., at Naugatuck, Connecticut, have recently elected directors and officers. The directors of Goodyear's Metallic Rubber Shoe Co. are Walter S. Ballou, James B. Ford, Samuel Norris, W. T. Rodenbach and F. F. Schaffer. The officers are F. F. Schaffer, president; W. T. Rodenbach, treasurer; Charles T. McCarthy, secretary; Homer E. Sawyer, general manager; John D. Carberry, assistant secretary; and Charles S. Myers, assistant treasurer.

The directors of Goodyear's India Rubber Glove Manufacturing Co. are Walter S. Ballou, John D. Carberry, Ernest Hopkinson, W. T. Rodenbach and F. F. Schaffer. The officers of the company are identical with those of the first mentioned company, with the exception of the assistant treasurer, which office in the latter company is held by C. C. Scholfield.

RUBBER COMPANY DIVIDENDS

The Apsley Rubber Co. has declared its regular semi-annual dividend of $3\frac{1}{2}$ per cent on preferred stock, payable July 1 to stockholders of record June 30.

A quarterly dividend of \$1.75 per share has been declared on both the common and preferred stock of The Barrett Co., payable July 2 to stockholders of record June 20.

The General Electric Co. has declared a stock dividend of \$2 per share, payable July 14 to stockholders of record June 16.

The Goodyear Tire & Rubber Co. paid a quarterly dividend of 3 per cent on common stock on June 1.

The Kelly-Springfield Co. has declared a quarterly dividend of \$1.50 per share on 6 per cent preferred stock, payable July 2 to stockholders of record June 18.

The board of directors of the Keystone Tire & Rubber Co. has declared a quarterly dividend of 2 per cent with an additional $\frac{1}{3}$ per cent on preferred stock and a regular quarterly dividend of 3 per cent on common stock, payable July 2 to stockholders of record June 22.

The Pennsylvania Rubber Co. has declared regular quarterly dividends of $1\frac{3}{4}$ per cent on preferred and $1\frac{1}{2}$ per cent on common stock, payable June 30 to stockholders of record June 15.

The Westinghouse Electric & Manufacturing Co. has declared a quarterly dividend of $1\frac{3}{4}$ per cent on preferred stock, payable July 16, and of $1\frac{3}{4}$ per cent on common stock, payable July 31, both dividends payable to stockholders of record June 30.

DE LISSER SUBMITS A WAR TAXATION PLAN.

Of the many forms of war taxation proposed during the past few weeks, none is simpler than that submitted by Horace DeLisser, chairman of the board of directors of the Ajax Rubber Co., to Chairman Simmons, of the finance committee of the Senate. The plan is to impose a universal levy of one-half of one per cent of the gross annual sales made by every business in the country. Such a tax, it is claimed, would net the government the required \$1,000,000,000, at the same time proving equitable, economical, easy to collect and in no wise disturbing to trade. Distributed to every article of merchandise sold throughout the United States, as well as covering lawyers' fees and other professional emoluments, it would offer little incentive for evasion.

BANQUET TO JESSE E. LA DOW.

Nearly one hundred persons attended the banquet tendered Secretary Jesse E. LaDow, of the Mansfield Tire & Rubber Co., Mansfield, Ohio, on his return from an extended tour to the Far East. In the unavoidable absence of the president, C. R. Grant, G. W. Henne, vice-president and general manager, acted as toastmaster. Besides the officers of the company, the directors, sales managers, heads of departments and their assistants there were invited guests including the mayor of Mansfield, and a number of leading local bankers and professional men. Several eloquent addresses were delivered, interspersed were songs and recitations. Mr. LaDow concluded the evening's entertainment with an interesting talk of great educational value on his trip and the details of his research in the plantations of the Far East. The affair was a most enjoyable one and much credit for its success is due to the committee: R. H. Sotherland, purchasing agent; P. H. Ober, general superintendent; H. W. Webster, sales manager, and A. C. Moore, assistant secretary.

RUBBER COMPANY SHARE QUOTATIONS.

The following market quotations of shares of rubber manufacturing companies on June 25 are furnished by John Burnham & Co., 115 Broadway, New York City, and 41 South La Salle street, Chicago, Illinois.

	Bid.	Asked.
Ajax Rubber Co. (new)	68 $\frac{1}{2}$	71
Firestone Tire & Rubber Co., common.....	115	122
Firestone Tire & Rubber Co., preferred.....	105	107

United States Rubber Co., common.....	107	107 $\frac{3}{4}$
United States Rubber Co., preferred.....		

CONSOLIDATION OF WESTINGHOUSE INTERESTS.

An important development in the affairs of the Westinghouse organizations, here and abroad, is the consolidation of the British, French and Italian Westinghouse companies. The powerful financial group in control is reported to have further plans for extension of interests, by which it will rival the great German company, the *Allgemeine Electricitats Gesellschaft*. The American Westinghouse company not only retains a financial interest in this combination, but an agreement of alliance has been made with the London group under which the American company trades in the Western Hemisphere and the Far East, including Asiatic Russia, and the British company in Europe, Africa and Australia, each company representing the other as sole agent in its respective territory for business that naturally gravitates toward the other.

TRADE NOTES.

To meet the demands of constantly increasing business the New York Rubber Co., New York City, has increased its capital stock from \$300,000 to \$500,000.

Gaston, Williams & Wigmore, Inc., New York City, have removed their offices from the Guaranty Trust Building to the Equitable Building, 120 Broadway.

The recently issued annual report of the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, shows a surplus of nearly double that of the year before. During the 12 months ending last March the company did a gross business of \$89,539,442, on which it realized a net manufacturing profit of \$17,461,690. Over a million dollars of miscellaneous income, including interest, dividends and royalties, brought the profit up to the \$18,000,000 mark.

The New Jersey Testing Laboratories, Montclair, New Jersey, have recently completed extensive additions to their offices and laboratories, the latter now occupying three buildings and being equipped to handle a large amount of research work, carrying tests to the semi-commercial stage, if desired.

The New York City offices of the General Electric Co. have been removed from 30 Church street to 120 Broadway, in the Equitable Building.

The L. Candee & Co., New Haven, Connecticut, has purchased the property of the Connecticut Pie Co. adjoining its plant and also the property belonging to the Yale Brewing Co. No definite plans have yet been formulated with reference to the use of these real estate acquisitions.

After July 1 the Oak Rubber Co., formerly operating in Akron, will be located in Ravenna, Ohio, this change being necessary to secure satisfactory quarters for the increased production of toy balloons, the company's exclusive product. Two and one-half acres located on North Chestnut street on the Erie Railroad, have been secured, and a factory will soon be built on this property.

Formal transfer was made of the Adams & Ford Co. property at Cleveland, Ohio, to the United States Rubber Co., New York City, on June 1. The Adams & Ford Co. is one of the oldest and largest distributors of rubber footwear in the Middle West and is the owner of the "Everstick" rubber.

The Kemp Rubber Co., Buffalo, New York, has moved to 246 Washington street. This concern, which has been operating for 20 years, carries a general line of rubber merchandise.

The Gillette Rubber Co., Eau Claire, Wisconsin, has commenced operation.

It is reported that the Dowse Rubber Co., recently incorporated, plans to take over an already equipped plant in Chicago, Illinois, and that the product of the company will be stamped "Dowse-Durability."

POLACK TYRE & RUBBER CO. APPOINTMENTS.

G. H. Miller has been appointed manager of sales and advertising for the Polack company, with headquarters at the New York City office.

William Domnich has been made representative of the company at Pittsburgh, Pennsylvania.

H. J. Kenney is manager of the branch at New Haven, Connecticut.

Carl Theodore Goldenberg acts as representative in the Virginia territory, with headquarters at Lynchburg.

Earl H. Pellett has been appointed manager of the Boston, Massachusetts, branch and will also supervise the Providence, Rhode Island, territory.

C. W. Smith has been made manager of the Washington, D. C., territory.

"Rubber Machinery," Mr. Pearson's newest book, filled with valuable information for rubber manufacturers, is now ready for mailing. Price, \$6.

THE REPUBLIC COMPANY'S NEW PRESIDENT.

At a recent meeting of the Republic Rubber Co., Youngstown, Ohio, Guy S. Norwood was elected president. Mr. Norwood is well fitted to assume this important position, having

Campbell Studio.

G. S. NORWOOD.

been intimately connected with the rubber business since the opening of this century. He is still a young man, having been born in Allegany, New York, in February, 1876. After completing his education, which was obtained at the local schools, the Cook Academy at Montour Falls, New York, and Cornell University, Ithaca, New York, Mr. Norwood went to the Eastman Kodak Co., Rochester, New York, in 1898 as industrial engineer. In 1901 he entered the

engineering department of The B. F. Goodrich Co., Akron, Ohio, five years later resigning to accept the management of the cost department of the Diamond Rubber Co., Akron. In 1910 he became director and assistant treasurer of that company and when the corporation was consolidated with The B. F. Goodrich Co. in 1912 he was elected to the directorship and given the position of assistant treasurer of the Goodrich company. In 1913 he became assistant secretary and early this year was elected secretary, the position which he resigned in order to accept the presidency of the Republic Rubber Co.

Mr. Norwood is a man of pleasing personality and has a wide circle of friends in the rubber business who will wish him every success in his new position. He is a member of the American Society of Political and Social Science and of the Franklin Institute. He is a thirty-second degree Mason, is treasurer of the Young Men's Christian Association of Akron and a member of the Akron University Club, of which he was president last year.

In this connection it might be well to mention that Thomas L. Robinson, former president of the Republic company, will continue as chairman of the board and in charge of the financial management of the corporation.

EXPANSION OF THE VULCAN RUBBER CO.

The Vulcan Rubber Co., Erie, Pennsylvania, is building a railroad siding to its plant from the line of the Pennsylvania Railroad. The new brick, fireproof factory buildings are also under construction, one three stories high and the other a one-story structure. An additional calender, mills and other equipment have been ordered and it is hoped to have the new buildings in operation by August 1. The present plant is being operated day and night on the company's products—inner tubes, solid truck tires, cements and tire accessories—and the manufacture of a hand-made fabric automobile tire is contemplated. The officers of the Vulcan company are as follows: M. Liebel, Jr., president; Edward Heuer, vice-president and treasurer; Bernard Cochran, secretary.

NEW INCORPORATIONS.

American Tire Distributing Co., The, May 10 (Indiana), \$25,000. Otto E. Anthony, Solon B. Selleck, John L. McFarland—all of Indianapolis, Indiana. Principal office, Indianapolis, Indiana. To buy and sell automobile tires, tubes and accessories.

Atlanta Tire & Rubber Co., Inc., June 25 (New York), \$5,000. Sydney Bernheim, 35 Nassau street, New York City; Catherine A. Weldon, 591 Seventh street, and Harry H. Jacobson, 555 Grand street—both of Brooklyn, New York.

Cleveland-Standard Tire & Rubber Co. of Los Angeles, May 17 (California), \$20,000. H. M. Lieb, 524 West Fiftieth street; E. B. Conlee, 245 South Hobard Boulevard, and E. L. Sprague, 1641 Seventh avenue—all of Los Angeles, California. Principal office, Los Angeles, California.

Condex Tire Co., Inc., June 16 (New York), \$75,000. Geo. Rosendale, Solomon C. Whitbeck and B. L. Walter—all of 52 Broadway, New York City. Tire repairs, etc.

Crescent Rubber Corp., June 11 (Delaware), \$1,500,000. E. R. Kelley, Elgin, Illinois; Geo. H. Gilberds, and R. S. Hanford—both of Chicago, Illinois. The office within the State of Delaware is with the Corporation Trust Co. of America, 486 duPont building, Wilmington, Delaware. To carry on a general rubber and rubber products manufacturing, buying and selling business.

Dodge, H. C., Inc., May 29 (New York), \$1,000. Harold C. Dodge, East Orange, Henry T. Randal, Maplewood—both in New Jersey, and Frederick K. Nixon, 120 Riverside Drive, New York City. To deal in insulating materials, etc.

Dural Rubber Corp., The, June 4 (New Jersey), \$200,000. J. E. Gill, Caleb S. Green and N. A. K. Bugbee—all of Trenton, New Jersey. Principal office, Room 711, Broad street Bank Building, Trenton, New Jersey. To manufacture, buy, sell, import, export and generally deal in rubber tires and rubber tubes for air craft, automobiles and other vehicles; rubber goods of every kind, character and description, all goods of which rubber is a component part, and the various materials entering into the manufacture of any and all such goods, etc.

Elm City Rubber Co., Inc., June 22 (New York), \$1,500. Sydney Bernheim, 35 Nassau street, New York City; C. A. Weldon, 591 Seventh street, and Harry H. Jacobson, 555 Grand street—both in Brooklyn, New York. Tires, etc.

Hilgert Shoe Corp., April 12 (Hornell), \$107,500. George W. Harper, L. J. Harper—both of 232 Sherman avenue, New York City, and James Harper, 343 Enfield street, Brooklyn, New York. Rubber and leather goods.

Hurd Tire Corp., May 26 (Delaware), \$150,000. George L. Hurd, Tenafly, New Jersey, George A. Wagner and Arthur G. Hurd—both of 754 Oakland Place, New York City. The office in the State of Delaware is with the Capital Trust Co. of Delaware, Dover, Delaware. To manufacture, buy, sell and deal in tires, motor engines, etc.

Kant Sink Swimming Harness Co., June 1 (Michigan), \$5,000. Milton D. Bryant, Robert W. Lyon. Principal office, Traverse City, Michigan. To manufacture rubber goods specialties.

Keystone Resilient Wheel Co., May 21 (Delaware), \$600,000. Herbert E. Latter, C. L. Rimlinger—both of Wilmington, Delaware, and Clement M. Egner, Elkton, Maryland. The office in the State of Delaware is with the Corporation Trust Co. of America, 486 duPont Building, Wilmington, Delaware. To manufacture and sell resilient wheels for automobiles and to deal in all kinds of tires.

Lake City Tire & Supply Co., The, April 27 (Ohio), \$10,000. A. H. Massey (president), 1298 West One Hundred and Tenth street; C. B. Bayly (vice-president), Leader News Building; L. J. Brown (treasurer), 11431 Clifton Boulevard, and H. C. Christy, Jr., (sales manager), 1301 West One Hundred and Sixth street—all in Cleveland, Ohio. Principal office, 4205 Euclid avenue, Cleveland, Ohio. Jobbers of automobile tires and supplies.

M. K. B. Rubber Co., May 18 (Delaware), \$50,000. Herbert E. Latter, C. L. Rimlinger—both of Wilmington, Delaware, and Clement M. Egner, Elkton, Maryland. The office of the corporation within the State of Delaware is with the Corporation Trust Co. of America, duPont Building, Wilmington, Delaware. To buy, sell and generally deal in rubber tires, tubes and accessories of all kinds for automobiles.

Manhattan Motor Supply Co., Inc., June 21 (New York), \$10,000. William Miller, 1074 Lexington avenue; Walter V. Burke, 355 West Fifty-eighth street, and Bailey C. Elliot, 1400 Broadway—all in New York City. To deal in auto tires, supplies, etc.

Moore & Ward, June 12 (New Jersey), \$25,000. George C. Moore, Harcourt S. Ward—both of 123 Washington street, and Robert N. Shoemaker, 790 Broad street—all in Newark, New Jersey. Principal office, 123 Washington street, Newark, New Jersey. To make, purchase and sell rubber tires and all other goods of which rubber is a component part, etc.

Moscow Airless Tire Co., Inc., June 1 (New York), \$50,000. Jonas Gerwitz, 1823 Prospect Place, Henry Gerwitz, 354 Saratoga Avenue,—both in Brooklyn, New York, and Rudolph Moskowitz, 315 Fifth street, New York City. Principal office, New York City. Auto tires and accessories.

New Era Double Tire Co., Inc., May 29 (New York), \$5,000. William W. Kupperman, 117 Oakland street; Harry P. Kupperman, 911 Grape street, and Gerson Rubenstein, 164 Renwick Place,—all in Syracuse, New York. Principal office, Fabius, New York. To deal in automobiles and tires.

Peavey Rubber Co., The, June 1 (Texas), \$100,000. R. A. Peavey, N. P. Deavours, and E. W. Ware—all of Dallas, Texas. Principal office, 2036 Commerce street, Dallas, Texas. To sell tires at wholesale and retail.

Radium Golf Ball Co., The, April 12 (New York), \$5,000. Leo L. Levenritt, (president), 128 Broadway, New York City; Ellis Miller, (vice-president), London, England, and J. S. Worthington, Midsunvey Golf Club, England. Principal office, 128 Broadway, New York City. To introduce and promote the sale of a golf ball known as Radio.

Record Syringe Laboratory, Inc., May 28 (New York), \$3,000. Irvin Rosenfeld, Joseph L. Rosenfeld, both of 1538 Minford Place, and Herman A. Weis, 1687 Southern Boulevard—all in New York City. Principal office, Bronx, New York. To manufacture syringes and surgical goods.

Serlin Tire Co., May 23 (Illinois), \$10,000. Nathan Serlin, Sam Serlin and Max Serlin. Principal office, 1300-2 South Michigan avenue, Chicago, Illinois. To manufacture, buy and sell, at wholesale and retail, tires and automobile accessories, of every kind and nature, etc.

Southern Tire & Accessories Co., April 24 (Alabama), \$2,500. Solon Jacobs, J. F. Fenton, and Evans Dunn. Principal office, Birmingham, Alabama. To buy and sell automobile tires and tubes and some other rubber goods and to handle a line of automobile accessories. This company succeeds the Solon Jacobs Tire Co.

Texas Tire Co., April 18 (Texas), \$25,000. Sam Hefley, H. W. Hefley—both of Cameron, Texas, and E. M. Hampton, Dallas, Texas. Principal office, Dallas, Texas. To manufacture and sell automobile tires and accessories.

Tire Stores Co. of America, April 4 (West Virginia), \$500. Milton Reinsberg, 7023 Joffrey street, and Simon Reinsberg, 722 East Fiftieth street—both in Chicago, Illinois. Principal office, 906-6 North Clark street, Chicago, Illinois. To generally deal in tires for automobiles, bicycles, carriages, etc.

Whinihan Brothers & Co., Inc., May 23 (New York), \$5,000. Sylvester M. Whinihan, Paul K. Whinihan and Charles B. Brittin—all of Buffalo, New York. Principal office, Buffalo, New York. Tires and tubes, etc.

CANADIAN CONSOLIDATED NOTES.

The new building at 201 Inspector street, Montreal, Canada, now occupied by the Canadian Consolidated Rubber Co., Limited, contains the executive offices, the sales department of the Montreal branch, and the raincoat manufacturing department. The location of this building is very central, and its nearness to the railroad stations will be a decided convenience to out-of-town customers.

At the Dominion Tire Factory of the Montreal company a first aid department has been installed, one of the buildings having been remodeled for the purpose. It will comprise an operating room, rest room and ante-room and will be equipped with complete surgical and nursing equipment in charge of a graduate nurse.

Contracts have been let for the erection of a home building at Port Dalhousie for the female workers of the Maple Leaf factory of the company.

The Granby Rubber Co., Granby, Quebec, Canada, is building new offices and warehouses, which are needed for the growing business there. As soon as the new building can be occupied the present office building will be demolished, and the new warehouse will be extended over the ground thus vacated.

THERMOID RUBBER CO.

Through the addition of new hydraulic press equipment, the Thermoid Rubber Co., of Trenton, New Jersey, has increased its yearly output of Thermoid Hydraulic Compressed Brake Lining nearly 30 per cent. This department is running over-time at full capacity, averaging an output of over 37,000 feet per day. The output for the year of 1916 totaled over 9,000,000 feet, which will be increased this year by the addition of the new press equipment to nearly 12,000,000 feet.

Harold F. Blanchard, former district manager of Philadelphia, Pennsylvania, office of the Thermoid company, has been transferred to the factory as manager of sales and advertising. He succeeds D. O. Pohlman, who has taken charge of the Central Western District, with headquarters at the Chicago branch office. J. H. Liston, formerly in charge of the Chicago territory, has joined the sales organization of the Standard Parts Co., Cleveland, Ohio.

MACKINTOSH WITH MAPLE LEAF TIRES, LIMITED.

Maple Leaf Tires, Limited, Belleville, Ontario, Canada, has elected as president W. M. Mackintosh, formerly with the North British Rubber Co., Limited, Edinburgh, Scotland, and several other European rubber concerns. It has also made a contract for his services for three years. Mr. Mackintosh has transferred to the company the Canadian rights for "Galbulose," a chemical combination of fossil resin and cellulose for proofing fabrics (described in THE INDIA RUBBER WORLD, November 1, 1914).

COPY OF INDEX TO "Rubber Machinery" will be sent free upon request.

THE SEAMLESS RUBBER CO., INC.

The real estate, machinery, trade-marks and good will of the Seamless Rubber Co., New Haven, Connecticut, having been purchased at public sale for \$681,000, the business will be continued by a corporation capitalized at \$1,500,000, under the name of the Seamless Rubber Co., Inc., with office and factory at New Haven. The new company will not manufacture tires and inner tubes, having disposed of the equipment formerly used in this branch of the business, but will continue on a larger scale the production of druggists', stationers' and

surgical sundries, hospital supplies and sporting goods. The new company is rapidly taking back the 700 employees of the older company; is adding new machinery and equipment; is sending the salesmen out on their former territories, and will continue the branch offices in New York City; Chicago, Illinois; San Francisco, California, and Toronto, Canada, but will carry no stocks of goods at these branches, shipping all goods from New Haven.

The officers of the company are F. O. Williams, president and general manager; F. W. Dodge, vice-president and assistant manager; H. W. Gordon, secretary and sales manager, and W. C. Hutton, treasurer.

NEW EXECUTIVE BUILDING OF CANADIAN CONSOLIDATED RUBBER CO., LIMITED, AT MONTREAL, CANADA.

RUBBER SCRAP DIVISION OF THE NATIONAL ASSOCIATION MEETS.

The meeting of the Rubber Scrap Division of the National Association of Waste Material Dealers was held June 19 at the Hotel Astor, New York City, with Paul Loewenthal in the chair. The increased attendance and active interest of those present were favorable indications of the progress of this division. The most important business transacted was the discussion attending the adoption of the new standards of rubber scrap specifications and packing known as Circular C, that will be sent out to the trade July 1. Full text of this circular is published on page 598 of this issue.

WORKMEN'S COMPENSATION INSURANCE.

For some time past the National Association of Waste Material Dealers has been endeavoring to secure lower rates for workmen's compensation insurance. At present, rubber stock dealers enjoy the lowest rate among waste material classifications, but it is expected that metal scrap and scrap iron dealers will soon be granted much lower rates than hitherto, and that the term "junk dealers" may be eliminated entirely, a new classification being provided to cover dealers handling waste paper exclusively. Present rates in various states for rubber stock dealers receiving, handling, baling and shipping old rubber, not available for division of payroll, are as follows: New York, \$2.01; Pennsylvania, \$0.88; Massachusetts, \$1.21; Illinois, \$1.64; Michigan, \$1.43; New Jersey, \$1.06; Maryland, \$1.15; Wisconsin, \$1.33; Indiana, \$1.56; Connecticut, \$1.23; Iowa, \$1.09; Louisiana, \$1.22; Maine, \$1.01; Nebraska, \$1.22; Rhode Island, \$1.10; Vermont, \$1.01; Kansas, \$0.89; Minnesota, \$1.17.

EDWARD S. BABCOX.

THERE are few, if any, positions in the advertising world which require so much ability, versatility, and solid hard work as publicity managers in the automobile and allied industries.

E. S. BABCOX.

A man who stands out prominently in this field is Edward S. Babcox, advertising manager of the Firestone Tire & Rubber Co., of Akron, Ohio, whose work in this department has made the name of Firestone almost a household word throughout the United States, as well as famous in far countries.

Although a young man in years, he has had a long and successful experience in the publicity field. Previous to coming to the Fire-

stone company he had been in charge of the advertising of the Burroughs Adding Machine Co., of Detroit, Michigan, and later of the Yawman & Erbe Manufacturing Co., Rochester, New York. That he is up-to-date was proved at the recent convention of the Association of National Advertisers at Detroit, when he brought home to his fellow publicity men the close relationship of advertising and selling, by exhibiting a motion picture film, which was produced for the sole purpose of impressing upon the sales force of the Firestone company the immense value of advertising as a selling argument.

At that convention Mr. Babcox was elected vice-president, which was a tribute to his earnest efforts in carrying out the aims of that organization, especially in eliminating fraudulent advertising.

FIRESTONE PROMOTIONS.

J. E. Mayl, formerly branch manager at Memphis, Tennessee, for the Firestone Tire & Rubber Co., has been appointed manager of the company's Cleveland, Ohio, branch, E. C. Thomas taking his place at Memphis.

J. H. Dutch has been made manager at Pittsburgh, Pennsylvania.

A. T. Smith, formerly manager of the Los Angeles branch, has been placed in charge of the San Francisco, California, branch, F. C. Flickinger succeeding him at Los Angeles.

Roscoe Homan, who joined the Firestone forces in 1914, as Omaha salesman, has been appointed manager of the Oklahoma City branch.

John Beakley, formerly Texas credit manager, is now Texas manager.

TIRE REPAIR GOODS BUSINESS BRISK.

The rising cost of automobile tires is leading motorists generally to devote more attention to their tire equipment. Cars are being driven more carefully, poor roads and highways under repair are being avoided whenever possible, and wheel alinement and brakes are being tested. It has been discovered, too, that "a stitch in time saves nine," and sales in repair goods of every sort are showing a big increase as a result of the call for greater tire economy. Preparations for filling cuts and bruises in casings are particularly in demand.

AJAX APPOINTS SALES SUPERVISORS.

H. L. McClaren, vice-president and general manager of the Ajax Rubber Co., Inc., New York City, has worked out a new system of sales supervision in the various selling territories, and in adopting this system of bringing about a closer relationship between Ajax dealers and the home office, the following men have been promoted to the position of supervisors in the territories named:

S. L. Blood, upper New York; Richard Cluman, Connecticut; R. T. Jollie, Jr., Ohio, West Virginia and Kentucky; F. C. Burnett, Texas; W. J. Ryan, Minnesota, northern Wisconsin and northern peninsula of Michigan; P. V. Dowling, New Jersey and Pennsylvania; William M. Pattison, Maryland, North Carolina, South Carolina, Virginia and District of Columbia; S. H. Pierce, Illinois and southern Wisconsin; E. D. Winans, Rhode Island, Maine, Vermont and Massachusetts; E. E. Pickering, Nebraska, a part of Kansas, North Dakota, South Dakota and Colorado; A. G. De Vries, Indiana and Michigan; and G. L. Severcool.

FISK TIRE SERVICE

In order to aid motorists to get greater mileage from their tire equipment, The Fisk Rubber Co., Chicopee Falls, Massachusetts, has established approximately 130 branch houses in principal cities throughout the United States with completely equipped service stations where any work, aside from actual repairs, will be done upon tires free of charge and without obligation of any kind whatsoever. This service is available to every person who drives a car, regardless of the make of tires he uses, and includes changing of tires, mounting spares on rims or wheels, inflation, testing of air pressure, wheel alinement and brakes, regular and frequent expert inspection and advice. A complete branch list will be sent to tourists on request.

Service is the maxim of the Fisk company and this unique and practical application of it will greatly reduce the tire expense of those who avail themselves of it. Its value to tire user and dealer alike cannot be overestimated.

PERSONAL MENTION.

Joseph M. Ward, for some time past connected with the Indianapolis, Indiana, branch of the United States Tire Co., has been appointed district manager for that section. C. A. Oldham, formerly identified with the same branch, has been made district manager of the St. Louis, Missouri, branch.

C. J. Connors, formerly special representative of the Marathon Tire & Rubber Co. in the Southwestern States, has been appointed manager of the company's division office and warehouse in St. Louis, Missouri.

Robert Graves, Jr., 1668 Broadway, New York City, is distributor for the well-known tires and tubes of the Gryphon Rubber & Tire Corp. A. C. Galbraith, formerly New York representative of The Globe Rubber Co., Trenton, New Jersey, is associated with Mr. Graves as New York sales representative.

A. J. Pennington resigned his position as general superintendent of the tire and tube mill of the Brunswick-Balke-Collender Co., Muskegon, Michigan, on June 1, to take effect August 1, having become associated as general manager with a large Eastern company not affiliated with the rubber industry.

A HANDY DESK APPURTENANCE IS BEING SENT OUT BY THE Connecticut Mills Co., of Danielson, Connecticut, and Taunton, Massachusetts. It is a paper-weight of glass and contains a drawing representing the combined mills of the company and the houses erected for employees. Embedded in the bottom of the paper-weight is a square mirror sufficiently large to be a convenient accessory to the office desk.

COMMANDANT OSTERRIETH IN AMERICA.

MANY of the visitors to the International Rubber and Allied Trades Exhibitions of 1911 and 1914 will remember Commandant Leon Osterrieth as the delegate for Belgium. With his

CAPTAIN COMMANDANT LEON OSTERRIETH.

brother and other relatives he was associated with Osterrieth & Co., Antwerp, a firm of merchants dealing in rubber and allied tropical products and owning considerable interests in the plantation industry of Java, and British Malaya. When war was declared in 1914 Commandant Osterrieth was on his way to attend the Rubber Congress in Java. He heard the news at Port Said, returned hastily and until recently has been fighting with his countrymen in the trenches of Flanders. His mother, too, well known and beloved in Antwerp for her many acts of benevolence covering a period of many years, has continued to do much to alleviate the suffering of those about her. Commander Osterrieth's active cooperation has aided materially in the success of the International Rubber Exhibitions, and it will be recalled that rubber from his own and his brother's estates was exhibited in New York in 1912. The welcome of the American rubber trade to such a distinguished visitor is the warmer in that it is extended to an honored comrade in arms.

PERSONAL MENTION.

George O. Simpson has been appointed manager of the Kansas City branch of The B. F. Goodrich Co., succeeding F. A. Oberheu. Mr. Simpson has been connected with the Goodrich company for ten years, having been for three years a salesman in the Philadelphia, Pennsylvania, territory and for the past seven years manager of the Philadelphia branch.

The transfer of George O. Simpson, Philadelphia branch manager of The B. F. Goodrich Co., and the welcome of his successor, Edward H. Fitch, was the occasion of a recent banquet given at the headquarters of the Philadelphia Automobile Trade Association. Prior to the dinner, a solid silver service was presented to Mr. Simpson as a demonstration of the loyalty and friendship of his associates. Among the speakers was C. B. Raymond, second vice-president of the Goodrich company.

Alfred L. Aiken, governor of the Federal Reserve Bank of Boston and a potent factor in the success of the New England drive for Liberty Bond subscriptions, is a grandson of the late Governor Buckingham of Connecticut, who was one of the founders of the old Hayward Rubber Co., of Colchester.

O. R. L. J. Magnee, who has rubber planting interests in Sumatra, was in New York City last month on business.

C. E. Labelle, treasurer of the St. Jerome, Quebec, factory of the Canadian Consolidated Rubber Co., Limited, recently married Miss Jeanne Belair, the couple taking a honeymoon trip down the Saguenay River. The overseers and office staff presented to them a cabinet of table silver.

TRADE NOTES.

The Central Tire Co., distributor of Diamond tires, San Antonio, Texas, has increased its capital stock from \$12,000 to \$25,000.

The Polack Tyre & Rubber Co., New York City, has moved its general and sales offices to more commodious and pleasanter quarters on the second floor of the Motor Mart, 1876 Broadway. This change was made necessary by a rapidly expanding business with truck users and truck manufacturers.

The Perfection Asbestos Tire Co., Cleveland, Ohio, has been formed as Ohio distributor for The Perfection Tire & Rubber Co. H. L. Oakley is president and Edward F. Carran, secretary and treasurer.

The Perfection Tire & Rubber Co. is enlarging its plant at Wabash, Indiana, and installing machinery that will triple its capacity. This factory is utilized for the manufacture of asbestos automobile tire fabric, asbestos yarns and fabrics, asbestos gaskets and packing, and asbestos shoe soles.

Bids are being received for the erection of a one and two-story building, 125 by 60 feet, to be built for the Plexus Tire & Rubber Co., Philadelphia, Pennsylvania.

The Newark Rubber Tire Co., Newark, New Jersey, dealer in standard makes of tires and tubes, has increased its capital stock from \$10,000 to \$100,000. The officers of the company are: William F. Rothlisberger, president; Harry Martin, vice-president and secretary; E. B. Degenring, treasurer.

The plant of the Mid-Continent Tire Manufacturing Co., located at Wichita, Kansas, is rapidly nearing completion and it is claimed that it will be the largest factory building in Kansas. That the new plant will be turning out "Made in Wichita" tires by midsummer is the hope of the management.

The Camel Tire Co., jobber in standard brand tires, has opened new quarters at 712 Madison avenue, Toledo, Ohio.

HANES RUBBER CO.

The Hanes Rubber Co., Winston-Salem, North Carolina, will soon start manufacturing tires and inner tubes, the daily capacity being 300 tires and 200 tubes. This is not a stock company, but a private corporation having a capital of \$500,000. A. S. Hanes, the president, and J. W. Hanes, Jr., secretary and treasurer, are identified with the Hanes Knitting Mills Co. of the same place, and it is planned that this company will make the tire fabrics. The plant is admirably situated, as regards railway

PLANT OF THE HANES RUBBER CO.

facilities, being closely connected with the Southern, the Norfolk & Western and the South Bound railways. Being near a town of 35,000 inhabitants, in a cotton industrial center, the plant is very favorably situated also, as regards labor supply.

It is reported that the North Star Rubber Co., of St. Paul, Minnesota, will soon be in a position to operate. The company has temporary headquarters in the National Exchange Bank Building.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

ONE of the most dangerous fires this year in Boston occurred June 4, when the rubber substitute plant of T. C. Ashley & Co., in the South Boston section, was destroyed. Situated as the factory was in a neighborhood of inflammable structures, the fire was peculiarly difficult to fight. About three acres were burned over, including a large stable, and a building occupied by the International Waste Co., where 1,300 bales of cotton waste were burned. The Ashley factory was totally destroyed, but with the enterprise characteristic of the concern a new location has already been secured, and it is expected that the firm will resume manufacturing within two or three weeks. The new plant is in a substantial brick structure in the Brighton section of this city. The business office will remain, as heretofore, at 683 Atlantic avenue, opposite the South Terminal Station.

* * *

The Doughty Tire Co., whose factory is at Providence, Rhode Island, has opened an office in the new Little Building, corner of Boylston and Tremont streets in this city, and is doing some very effective advertising in the daily press. This company is manufacturing the tire invented and patented by Henry J. Doughty which was fully described in THE INDIA RUBBER WORLD, February 1, 1916. A special loom weaves a continuous fabric strip molded to the exact width and shape of the tire. A special friction calender impregnates this curve-shaped fabric with rubber, and the carcass is made complete by winding the fabric four times by machinery. Not more than five minutes is necessary to make the carcass ready for the cushion, breaker and outside rubber tread stock. The vulcanizing machine has a collapsible core made in eight segments, in combination with a three-part mold, to form the outside of the cover. All these parts are supplied with means of heating. The casing is laid in place and allowed to remain in the hot mold from ten to 20 minutes, according to size, to complete the vulcanization under a hydraulic pressure of 25 tons. The result is a tire which it is claimed is much stronger and which, because of the quickness of production can be produced more economically than the regulation tire. The company at present is manufacturing only one size, 30 by 3½ inches, but will make other sizes in the near future. It will enlarge its present equipment in Providence and plans in the near future to take over a large factory in Boston. The business office mentioned above is in charge of Henry M. Whitney, well known in financial and public service circles in Boston.

* * *

The Boston Woven Hose & Rubber Co., of Cambridge, gave a unique entertainment to over four-score of its New York City customers recently. A dinner was tendered them at the Machinery Club, in that city, at which Geo. E. Hall, vice-president and general manager presided. Addresses were made by R. J. Owens, manager of the New York office, and J. W. Fellows, factory manager. The feature of the evening was the presentation of a motion picture "The Story of Rubber, What it is and What it Does," illustrating the industry from the gathering of crude rubber in Brazilian forests and East Indian plantations, through the various processes of manufacture at the company's works at Cambridge. This exhibition was accompanied by a descriptive lecture by R. E. Conder, the advertising manager of the company. The affair was highly appreciated by the guests of the evening.

* * *

The B. F. Goodrich Co.'s salesroom window on Boylston street has become noted for its original and attractive displays. Last month the entire space was devoted to exploiting Textan fiber soles. The setting consisted of very effective full-size reproduction of the front porch of a suburban residence, the front door, windows, electric lanterns and portico columns being

true in detail. Chairs and hammocks were provided for father and mother and the little daughter. Both the latter were pointing to the soles of their shoes, on which the trade-marked word was visible. The foreground represented a lawn, and on the "grass" were samples of Textan soled shoes and Textan soles. It was surprising to see how many pedestrians and motorists stopped to admire the display.

* * *

Early last month the Hood Rubber Co. moved its tire department into the new building built expressly for it, and has a far larger tire capacity. It is hoped that it can now keep pace with the increasing demand for tires. The new foundry building is also finished and occupied. A new heater house is now in process of erection. The footwear department is running to full capacity, and the daily ticket is now 76,000 pairs of rubbers, boots and tennis.

* * *

Frederick T. Ryder, Jr., manager of the mechanical department of the Dexter Manufacturing Co., Boston and South Braintree, Massachusetts, was married June 2 at Burlington, Kansas, the bride being Garda Gertrude, daughter of Mr. and Mrs. Samuel D. Reid of that city. The couple now are on their honeymoon trip, and will reside in the Allston district of Boston. Mr. Ryder is the son of Frederick T. Ryder, for some years private secretary to the late E. S. Converse, and now prominent in the Rinex sole department of the United States Rubber Co.

* * *

A curious accident at a Peabody tannery early last month might be used as an argument in favor of rubber over leather belting. When the engineer turned on steam at the factory, a throttle valve blew out and steam under pressure of 50 pounds escaped, filling the boiler- and engine-rooms. This so injured the belts as to necessitate a shut-down of the works until belting experts had repaired the damage.

* * *

The Summer Street Tire Co. has opened a retail store for the sale of tires and accessories at the junction of Summer and Federal streets, very near the South Terminal Station. It is in charge of E. V. Murphy.

* * *

The Cor-Nix Rubber Co., which has stores for the sale of tires and rubber goods at Lynn and Beverly in this state, has just opened a third store at 46 North Main street, Fall River, in charge of John M. Corcoran, formerly a traveling salesman for the United States Rubber Co. The members of this concern are James F. Corcoran, Joseph P. Nixon (from whose names that of the company is derived) and William D. McCarthy, all of whom have had practical experience in the employ of leading rubber companies.

* * *

E. M. & F. Waldo, color manufacturers, New York City, will open a branch office at 10 High street, Boston, in order to give the New England trade the attention needed. T. H. Cushman, who for over two years has been New York and New England salesman for the Waldo concern, will be the manager.

* * *

Boston is getting to be more and more a convention city, chiefly through the exertions of the Chamber of Commerce, which is doing splendid work in many directions. It has a Convention Bureau to induce associations to hold important meetings here. Representatives of the American Chemical Society have informed this bureau that between 1,000 and 1,500 would unquestionably be present at its annual convention the week of September 10. The meetings of the society will be held at the Technology Buildings, with headquarters at the Hotel Lenox. The last convention held in Boston was in 1909, which was the most successful and largest attended of any in the history of the society.

Readers of THE INDIA RUBBER WORLD doubtless remember that the Forsyth Dental Infirmary in this city owes its establishment to the philanthropy of the Forsyth brothers of the Boston Belting Co. It will therefore be of interest to state that the trustees of this institution have established a course for the instruction of dental surgeons for the Reserve Corps of the United States Army. This course was given without charge by highly qualified instructors, who patriotically volunteered their services. Examinations for appointments are to be held later.

* * *

Honors continue to come to President Thomas A. Forsyth. The University of Pittsburgh conferred upon him last month the degree of Doctor of Laws. With a number of the directors of the Infirmary he attended the commencement exercises at the University at Pittsburgh, Pennsylvania. In an address there he reported that the 82 men of the graduating class of 84 in the department of dentistry have enlisted in the dental reserve corps. The two other graduates, women, will enter Red Cross work.

* * *

Elisha E. Converse, son of Harry E. Converse, president of the Boston Rubber Shoe Co., and grandson and namesake of Deacon Converse, the founder of that company, has enlisted in the Naval Reserve, and has received his commission as ensign.

* * *

R. F. Foote, superintendent and general manager of the Independent Rubber Co., Limited, Merritton, Ontario, Canada, was in Boston early last month. During his sojourn here, he visited the factories of the United States Rubber Co. in this vicinity. Mr. Foote has many friends in the trade, not only in Canada but in this country.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

THE big athletic meet on Decoration Day, in which the employes of the Goodrich, Firestone and Goodyear factories participated in friendly rivalry, was an even greater success than in previous years, over 15,000 people witnessing the different events. The B. F. Goodrich Co. carried off the highest honors, being awarded the large cup shown in the illustration on the total number of points scored in the meet, and also one of the smaller cups for winning the one-mile relay race. The other cup was awarded to the Goodyear Tire & Rubber Co.

The following table indicates the character of events and the points scored in the meet:

Events.	Goodrich.	Goodyear.	Firestone.
100-yard dash	3	1	5
Shot put	3	5	1
100-yard dash	4	3	0
210-yard dash	4	0	5
120-yard high hurdles.....	5	1	3
Pole vault	3	6	0
440-yard dash	8	1	0
880-yard run	8	1	0
Discus throw	5	4	0
Five-mile run	0	4	5
High jump	1	4	4
Broad jump	1	3	5
220-yard high hurdles.....	3	1	5
Javelin throw	1	5	3
One-mile relay race	5	3	1
Total points	56	42	37

* * *

Some idea of the myriad tasks to which rubber is put may be gathered from the knowledge that the molded goods department of The B. F. Goodrich Co. employs approximately 50,000 molds in the manufacture of 25,000 different rubber articles. In this department alone 1,000 rubber compounds are used.

George Lippincott Brown, who has recently become connected

with The B. F. Goodrich Co., has been identified with sales promotion work in sporting goods in New York for ten years, with Abbey & Imbrie, Abercrombie & Fitch Co., and as sales manager for A. F. Mersselbach & Bro., of Newark, New Jersey. Mr. Brown is an enthusiastic and skilful fisherman, and is well known among the sportsmen's organizations.

W. O. Rutherford, general sales manager of the Goodrich company, delivered an address at the annual World's Salesmanship Congress in Detroit, Michigan, last month.

* * *

The Portage Rubber Co. is now building two additions to its plant in Barberton, each approximately 75 by 100 feet, three stories high, of brick, steel and concrete construction. All of the equipment is ordered, and it is expected that the new additions will be in operation by next January, enabling an increase in production of fully 800 more tires and 1,000 more tubes per day.

The Portage company recently distributed \$45,000 in payment of its quarterly dividend of 2½ per cent.

* * *

The Firestone Tire & Rubber Co., up-to-date in all of its methods, is insistent upon proper attention to the teeth of its employes as an important factor in their health. No less than 20,000 cases are treated in the clinic annually, advice and service being free to all employes.

Edward S. Babcox, advertising manager of the Firestone company, has been elected vice-president of the Association of National Advertisers.

* * *

The production of the Amazon Rubber Co. has increased five-fold within the last ten months, and plans are now being considered for a new five-story brick factory building, to be equipped with the latest rubber machinery.

L. J. Myers has been placed in charge of Amazon sales.

* * *

E. H. Barnhill has been appointed manager of the fabric department of the Goodyear company, succeeding Theodore Wood.

* * *

The Loewenthal Co., of New York and Chicago, dealer in rubber scrap, has opened a branch office in the Delaware Building, Akron, Ohio, under the managership of H. C. Jones, formerly in the salvage department of The B. F. Goodrich Co.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

THE census of manufacturers for 1914 issued about the middle of the past month by the Bureau of Census of the United States Department of Commerce contains information of more than usual interest to the rubber industry. Rhode Island ranks nineteenth among the States in value of products of its manufacturing industries, and fourteenth in average number of wage earners.

During 1914 there was an average of 1,541 wage earners employed in the rubber industry, the total value of whose production was \$6,088,988, the value added by manufacture being \$2,026,579.

A comparative summary for 1904, 1909 and 1914 is very interesting and instructive, showing the following: In 1904 there were 9 establishments in the Rhode Island rubber industry, employing 991 persons, receiving wages that amounted to \$417,000; using material costing \$1,636,000, the value of productions being \$2,582,000. In 1909 there were only 5 establishments, employing 774 wage earners, using 1,075 primary horse power, earning \$320,000 in wages, using materials costing \$2,075,000 and producing \$3,143,000. In 1914 six establishments employing 1,541 used 3,350 primary horse power. Wages amounted to \$821,000, the cost of materials was \$4,062,000 and the value of the production was \$6,089,000.

The United States Rubber Co. has purchased outright the entire business and chain of plants of the Rubber Goods Manufacturing Co., including the factory at Providence. Since 1905 the United States Rubber Co. has held a controlling interest in the corporation that it has now taken over, and the transfer just recorded is in line with the announced policy of the parent company to centralize the administration of its many holdings.

* * *

Col. Samuel P. Colt, president of the United States Rubber Co., and a party of friends left early in the month for Col. Colt's camp in the Maine woods, where they enjoyed three weeks of fishing and camping. The camp is located on a chain of lakes at the base of Mount Katahdin amid beautiful scenery about 35 miles up the Penobscot river from Norcross, the trip to Norcross being made in canoes. Trout and bass abound in the lakes and streams of this territory.

The party consisted of the following: Mr. and Mrs. Andrew Weeks Anthony, Col. and Mrs. Harold J. Gross, Dr. Calvin S. May, Walter S. Ballou, Mr. and Mrs. E. A. Barrows, Mrs. Florence Beresford, Ernest Hopkinson, Countess Eleanor Moroni, Mrs. Imogene S. Waldron, S. X. Constantinidi, Mrs. John W. Bicknell, H. Stuart Hotchkiss, Nathaniel Myers and A. W. Bahr.

* * *

It may be remembered that the overseers and employes of the National India Rubber Co. decided to purchase a motor ambulance as a memorial to the late LeBaron C. Colt, former vice-president and manager of that corporation, the ambulance to be operated between Providence, Pawtucket, Fall River, Wallum Lake, etc., and to be housed

THE LEBARON C. COLT MEMORIAL AMBULANCE, in the garage at the factory

of the National company. This was believed to be a memorial which would serve a useful purpose and be far more highly appreciated than a tablet or a monument. The ambulance has just arrived and, as shown in the illustration, is of the latest design, being built expressly for the committee having the matter in charge. This committee consisted of George Schlosser, James W. Franklin, Frederick L. Dunbar, Wendell R. Davis, and Edward E. Bunn. The ambulance has a silver tablet bearing the following inscription: "In Memory of LeBaron Carleton Colt. Given by the People of Bristol, Rhode Island."

* * *

Pursuant to an agreement made between Jesse P. Walsh, manager of the American Wringer Co., and a committee of the employes who went out on strike about the middle of last month, the 600 employes of the company have returned to work. The agreement is for full time and a 20 per cent bonus, instead of a 10 per cent one under, which the operatives had been working since the strike of a year ago.

Charles McGinley, of Woonsocket, who for the past six years has been employed at the American Wringer Co.'s plant in that city, has been appointed salesman of the mechanical roll department. He will have for his territory the southern part of New York State, all the States as far south as Georgia and as far west as Ohio, and also Texas.

The American Wringer Co. has had constructed a large garage of brick and wood in connection with its plant on Social street, Woonsocket.

The semi-annual convention of the sales force of the Davol Rubber Co. was held during the week of June 18 at the office in Providence. P. R. Wesley, general sales manager, was in charge of the meetings, which were full of interest and instruction to the salesmen. For entertainment the visitors were given the Rhode Island johnny cake and chicken dinner one day, a real Rhode Island clambake the next, and on the evening of the twenty-second, C. J. Davol, president and treasurer, gave a complimentary banquet to the sales force and heads of departments. During the informal talk following the banquet Mr. Davol stated that the past six months had been the most successful in the history of the company, which is now in its forty-third year, having been established in 1874 by Joseph Davol, father of the present president and treasurer.

* * *

The factory of the National India Rubber Co., at Bristol, in its shoemaking departments, will be closed down early in August, probably the eleventh, for the period of two weeks, for the purpose of taking the annual inventory of the stock on hand in raw material and manufactured products, and also to make an overhauling of machinery and equipment.

* * *

Thomas S. Walker, for several years connected with the Woonsocket Rubber Co., and later with the Lycoming Rubber Co., at Williamsport, Pennsylvania, has been transferred to St. Louis for organization work at the new factory of the United States Rubber Co. in that city.

HEWITT RUBBER CO. EXPANSION.

The Hewitt Rubber Co., Buffalo, New York, which has attained a high reputation for its manufactures of belting, hose, mechanicals and railway specialties, will add automobile tires to its line of products, and plans are well under way for the erection of a tire factory adjacent to its present plant, to have a capacity of 5,000 tires a day. It will increase its capital stock from \$500,000 to \$1,000,000.

J. H. KELLEY.

he had charge of the Chicago branch of the Republic Rubber Co., and in 1912, on the death of Vice-President Lomasney, he became vice-president of the company.

Another notable addition to the management is F. V. Springer, who has also been made a vice-president. Mr. Springer was connected with the Republic Rubber Co. for over ten years, and held the important position of manager of sales of the railway department of that company. He will act as assistant to Mr. Kelley, and as special representative of the company.

F. V. SPRINGER.

H. H. Hewitt continues as president, and W. C. Mullett is secretary and treasurer. The acquisition of this group of experienced leaders naturally means a still further expansion of the company's business, in its present lines of manufacture, and a similar enterprise and activity in the new line of manufacture upon which it is entering.

The Rubber Trade in Great Britain.

By Our Regular Correspondent.

THERE is no particular change in the trade conditions which have prevailed for some time past, although restrictions on the imports of raw rubber have naturally lead to some anxiety among manufacturers. The restrictions mentioned for reducing the present tonnage shipped from the Far East will, of course, leave more of the commodity available for direct shipment to America, a situation which is viewed with more equanimity on this side now than would have been the case had not America abandoned her neutrality. Another matter which has come to a head recently and none too soon in the opinion of a considerable number of our rubber manufacturers, is the official prohibition of the importation of rubber goods except under Board of Trade license. Of course this is only a war measure, but it is very welcome to those who have strenuously advocated an import duty. Whether it will have the same effect remains to be seen, as it all depends on to what extent and for what goods the licenses to import are issued. As people do not renew their rubber sponges every week—if they use them at all—there will be no hardship to the community in stopping the importation of sponges for some time, especially as a large firm of retail druggists with branches all over the country announces that it has half a million to dispose of at the popular price of 6d. each. Moreover, satisfactory rubber sponges are now being made in large quantities at home. Whether they will be sold at the low figure of 6d. when the competitive article is disposed of is a matter for speculation.

Further extensions are about to be made to the buildings and plants of the Leyland & Birmingham Rubber Co., Limited, at Leyland, and in order to finance this the company is issuing to shareholders 18,500 6 per cent cumulative preferred shares of £1 each in the proportion of 6 for every 180 of ordinary or preferred shares held.

THE GOODRICH DE LUXE TRUCK TIRE.

By way of an addendum to a recent note on this subject, the main object of this tire is to decrease road vibration, and this has been successfully done by increasing the ordinary 2-inch thickness of available tread to 3½ inches, the greater thickness of rubber making the relative loss by wear less than in a 2-inch tread. The percentage is but slightly higher, but it is claimed that the user obtains more for his monetary outlay. Users of De Luxe tires are said to have obtained in some cases double and treble their former mileages. For example, on heavy dump trucks carrying 6½ to 8 tons, where regular tires have repeatedly failed at 3,000 to 5,000 miles, De Luxe tires have gone 9,000 miles and more.

THE LATE I. FRANKENBURG.

By the death on May 5, at the age of 71, of Alderman I. Frankenburg, the Borough of Salford has lost one of its foremost public men and the rubber trade of the Manchester district one of its best known representatives. Mr. Frankenburg, who was born in Russia, came to England when 12 years old and after some years in London moved to Manchester in 1868 and started the manufacture of leather bags, knapsacks, etc. He made his first thousand pounds, as he told his workpeople in after years, by getting through a contract very rapidly for the French in connection with knapsacks for the Franco-Prussian war of 1870. It was some years before the business which now included waterproof garment making was moved to the present site in Greengate, Salford. These premises were added to from time to time as the business progressed, new branches were added and at the present time they occupy a considerable area and give employment to over a thousand hands. The firm of I. Frankenburg & Sons, Limited, is a private limited company so there is no public quotation of the shares. Directorships in the company are held by one or two heads of departments who have

thus an additional interest in the progress of the concern. It was at these works where the late C. O. Weber commenced his work and researches into the character of rubber, his first modest laboratory being a year or two before his departure from the firm replaced by one of much greater dimensions and of correspondingly improved facilities. Of Mr. Frankenburg's public work much might be said, but space merely permits mention of the fact that he was mayor of Salford for four years and a benefactor of numerous local philanthropic institutions.

THE PRODUCTION OF ACETONE.

I notice a paragraph in the May issue of THE INDIA RUBBER WORLD relating to the production of acetone from the mahwa tree of Hyderabad. This paragraph, I may say, has in substance already appeared in our daily press, and unless I am hopelessly wrong it is assuredly very misleading. I do not believe that acetone occurs anywhere in nature and therefore I am much surprised to learn that it occurs in large quantities in the flowers of the above tree. There is no alcohol in potatoes or starch, though it can be obtained therefrom by fermentation or chemical reaction. Acetone is obtained commercially by the dry distillation of acetate of lime, a compound of lime and acetic acid obtained by distilling wood, the yield being 1 ton of acetone from 100 tons of wood. As the mahwa tree flowers are stated to contain ten times as much acetone as wood does, I take it that 100 tons of these flowers will yield in distillation acetic acid sufficient to yield 10 tons of acetone. Whether the Canadian producers of acetone are fearful of the forthcoming competition I cannot say, but it would seem, on the face of it, to be a big job to collect flowers by the hundred tons. As regards the use of acetone as a solvent in the rubber industry—apart from the laboratory—I imagine that this has been mainly in deresinating plants, and as it is now a common thing to read in rubber specifications that deresinated rubber is not to be used, it would seem that acetone will be in lessened request.

RUBBER PLASTIC FROM KELP?

The special article on the recently developed kelp industry of southern California in the May issue of THE INDIA RUBBER WORLD is of wide chemical interest at the present time and the article is well worthy of being read by a wide number of chemical technologists. As to the importance of the movement for obtaining potash from kelp or seaweed, as was done on a small scale for many years in Scotland, there is general agreement, though as regards the use of kelp as a prospective rubber plastic I am not alone in holding pessimistic views.

AUSTRALIA PROTESTS BRITISH AUTOMOBILE EMBARGO.

In connection with the proposed British order prohibiting the importation of motor cars, the Motor Traders of Australia has brought to the home government's attention the disastrous effect such prohibition would have in Australia. Without desiring to appear unpatriotic or to be of hindrance to the government's national policy, the committee has set forth a plain statement of facts showing that the interruption of transportation afforded by motor cars would be serious. As to the tire business, the report states that owing to the heavy fall in motor imports in the latter half of 1916 (commencement of 1917 fiscal year) and curtailment of miles run on the score of economy, the addition of an embargo would have a serious effect on the entire tire industry. Under normal conditions wages paid by tire manufacturers amount to \$120,000 per annum. The trade hopes that the government will not take such drastic action as to permanently damage the industry.

RUBBER GROWERS' ASSOCIATION.

W. O. Hart has been elected to fill the vacancy, as representative at The Hague of this association on the Executive Board of the International Association for Rubber Cultivation in the Netherlands Indies, caused by the death of C. A. Lampard.

The question of appointing official representatives of the Netherlands Indies Committee in Java and Sumatra and the interchange of ideas with such representatives is under consideration by the Rubber Growers' Association.

LIST OF BRITISH EMBARGOED RUBBER MATERIALS.

A PROCLAMATION, dated May 10, consolidates, amends and adds to, the list of goods which were prohibited to be exported from the United Kingdom to certain or all destinations by the Proclamation of May 10, 1916, as amended and added to by subsequent Orders of Council. The materials used in the rubber industry that were included in the list of prohibited exports are given below.

The prohibition of exports is as follows:

Goods marked (A), to all destinations.

Goods marked (B), to all ports and destinations abroad other than ports and destinations in British Possessions and Protectorates.

Goods marked (C), to all destinations in foreign countries in Europe and on the Mediterranean and Black Seas, other than France and French Possessions, Russia, Italy and Italian Possessions, Spain and Portugal, and to all ports in any such foreign countries, and to all Russian Baltic ports.

- (A) Acetic acid.
- (A) Acetones and their compounds and preparations.
- (B) Antimony, sulphides and oxides of.
- (C) Apparel, waterproof wearing, not otherwise specifically prohibited.
- (B) Asbestos and articles wholly or partly of asbestos.
- (C) Asphalt.
- (C) Asphalt, coal tar.
- (C) Balsams.
- (B) Barium sulphate.
- (B) Beeswax.
- (A) Benzol and its compounds and preparations.
- (C) Bitumen, liquid or solid.
- (C) Bone black.
- (C) Boots and shoes not otherwise prohibited.
- (B) Cables, insulated.
- (B) Cadmium, alloys of cadmium and cadmium ore.
- (A) Carbon disulphide.
- (A) Carbon gas.
- (B) Carbon tetrachloride and its preparations.
- (C) Clay, China, potters' and ball.
- (C) Cotton, all manufactures, mixtures, and products of, not otherwise specifically prohibited.
- (A) Cotton, Sea Island, yarn made from or containing.
- (A) Glycerin, and preparations containing glycerin not otherwise specifically prohibited.
- (B) Gums containing caoutchouc.
- (B) Hexamethylene tetramine (utropin) and its compounds and preparations.
- (C) Iron, oxides of.
- (A) Lead compounds, and mixtures containing lead compounds.
- (A) Magnesite, caustic or lightly calcined, and dead burnt magnesite.
- (B) Mica, mica splittings, mica powder, micanite, and articles made from and insulating materials containing them.
- (B) Motor spirit (except benzol).
- (B) Paraffin oil.
- (A) Paraffin wax.
- (B) Petroleum spirit and articles containing petroleum spirit.
- (B) Plumbago.
- (B) Resinous substances containing caoutchouc.
- (A) Rubber (raw, waste and reclaimed), solutions containing rubber, jellies containing rubber, and any other preparations containing rubber, and also balata, gutta percha, and the following varieties of rubber, viz.: Borneo, Guayule, Jelutong, Palembang, Pontianac, and all other substances containing caoutchouc.
- (B) Rubber, gutta percha or balata, goods made wholly or partly of.

- (B) Shellac.
- (A) Soda caustic.
- (A) Sulphur and preparations containing sulphur.
- (A) Sulphuric acid and mixtures containing sulphuric acid.
- (C) Talc, all forms, including French chalk.
- (A) Tar, coal.
- (B) Tar, vegetable.
- (B) Tar, wood.
- (B) Tires for motor vehicles and for cycles (whether attached to a vehicle or cycle or not), together with articles and materials especially adapted for use in the manufacture or repair of tires.
- (A) Toluol and its compounds and preparations.
- (B) Turpentine (oil and spirit), and articles containing turpentine.
- (C) Wax, carnauba.
- (B) Waxes, animal, mineral, vegetable, and composite waxes, not otherwise prohibited.
- (A) Xylol and its compounds and preparations.
- (A) Zinc oxide.
- (B) Zinc sulphide.

AMERICAN FLAG ON THE FRENCH GOODRICH FACTORY.

The B. F. Goodrich Co. has an extensive factory at Colombes, France, a picture of which is shown here. The workers at this factory sent an enthusiastic cablegram to their American co-workers recently. Translated it reads:

THE B. F. GOODRICH FACTORY AT COLOMBES, FRANCE.

With sincere and brotherly feeling, and from our heart, we salute the unsullied stars which shine today alongside our Tri-Color Flag in the sky of Liberty, Justice and Right. Bravo, comrades of Akron! Hurrah for President Wilson!

GOODRICH STAFF, COLOMBES, FRANCE.

A PERMANENT SAMPLES EXHIBITION AT LYONS, FRANCE.

The Lyons Fair Committee has decided to create a permanent Samples Exhibition at Lyons, combined with a Commercial Enquiry Office, in connection with the annual Fair. This permanent exhibition will consist of samples shown at the annual Fair and deposited by the exhibitor till the next Fair, when he can either replace the samples by others or leave them on view. It is hoped eventually to get together a large collection of samples, constituting a permanent industrial exhibition of great value. In order that no time may be lost in putting this scheme into execution, exhibitors at the 1917 Fair are being invited to support it at once.

THE BORDEAUX FAIR, 1917.

The second Bordeaux Commercial Fair will be held from September 1 to 15, 1917. It will be mainly a French Colonial Fair, but exhibits from allied and neutral countries will also be received. Applications for space should be addressed to *L'Administration de la Foire de Bordeaux*, Hotel de Ville, Bordeaux, France.

"Rubber Machinery," Mr. Pearson's newest book, filled with valuable information for rubber manufacturers, is now ready for mailing. Price, \$6.

Rubber Planting Notes.

JAPANESE RUBBER GROWERS IN MALAYA.

THE declaration of officials in the Federated Malay States that no persons other than natives, British and naturalized citizens will be allowed to lease State lands, is a severe blow to Japanese rubber growers in those territories. Japanese planters were exceedingly prosperous and owned rich plantations, the largest of which is capitalized at \$2,492,500 and has an area of 10,000 acres.

It is stated that the Kuhara Mining Co. intends to form a rubber company. The two companies will be separate, but the older one is to be the larger shareholder. Meanwhile, it seems that 2,560 acres of land in Borneo, planted with rubber trees of 1 to 5 years' growth, have already been acquired and that this holding will be enlarged.

GERMAN NEW GUINEA UNDER AUSTRALIAN DOMINATION.

Several years before the war broke out, German New Guinea was beginning to be a promising source of rubber and gutta percha. Under the Germans *Ficus* and *Castilloa* were being thrown out and *Hevea* and coconuts planted instead. Although no new rubber has been planted by the Australians, that existing is receiving attention so that the exports for August, 1915, were valued at 2,000 marks, an amount which increased to 22,898 marks in September. At present, tapping has been suspended and the trees allowed a period of rest.

The labor shortage, aggravated by inadequate shipping facilities and the prohibition of recruiting in certain districts, is viewed with considerable concern, but when it decreases the prospect for *Hevea* cultivation is thought to be good.

In general it is stated that Australia has taken up her task in a broad-minded manner and that the country is prospering. Shipping to and from Australia is frequent and regular, a radio-telegraph station has been installed at Rabaul, a sufficient circulation of money has been provided for and a branch of the Australian Commonwealth Bank has been established.

RUBBER IN BRITISH NEW GUINEA.

The Galley Reach Rubber Estates, Limited, in Papua, owns about 404 acres of cultivated land, half of which is covered with rubber seven years old and over. For the year 1916 the yield was 27,499 pounds, or 2.06 pounds per annum per tree in bearing. The total cost per pound of rubber is at present 42 cents (U. S. currency), but it is hoped to reduce this considerably when all the trees are in bearing. In spite of the high cost and the initial difficulties which young enterprises always experience, the company recorded a profit of £1,104 for the year, which is being carried forward. The crop for 1917 is estimated at 33,000 pounds, and the cost, f. o. b. Port Moresby, at 29 cents per pound.

RUBBER SAMPLES FROM NORTHERN NIGERIA.

The Imperial Institute, London, England, recently published the results of experiments with a sample of rubber produced in Northern Nigeria. The sample lost 26 per cent in weight after washing, due to the large amount of impurities. Analysis of the residue gave:

Caoutchouc	49.2 per cent
Resin	47.7 per cent
Proteins	2.4 per cent
Ash	0.7 per cent

The caoutchouc thus separated was almost black and its physical properties were poor. From the analysis it was concluded that the sample probably came from the *Ficus vogelii*. Samples of this rubber from Gambia and the Gold Coast had previously been tested at the Imperial Institute.

COCHIN CHINA RUBBER PRODUCTION IN 1916.

According to the *Annales des Planteurs de Caoutchouc de l'Indo-Chine*,^a the amount of plantation rubber exported from this French colony during the first eleven months of 1916 was 489,000 kilos [1,075,800 pounds]. The exports for the whole year may be assumed to have been 530,000 kilos [1,166,000 pounds]. The total for 1915 was 573,440 pounds.

INDO-CHINA TRADE BUREAU.

Before his departure from France, the new Governor of Indo-China, Albert Sarant, discussed with Colonial Secretary Doumergue plans for establishing an Indo-China trade bureau at Paris. Trade experts will be at the head of this bureau and their duty will consist in circulating throughout the French commercial and industrial world a knowledge of the natural resources and trade possibilities of Indo-China. Promotion of the plantation rubber industry figures largely in the plan. Large credits will be drawn for this purpose. The bureau will work along practical lines and be absolutely independent of the Colonial department.

THE NETHERLANDS RUBBER INDUSTRY.

The Amsterdam rubber market, normally important, suffered in 1916, when both imports and exports were prohibited. The prohibition on imports went into effect November 26, 1915, but shipments leaving the Dutch East Indies (which supply practically the whole market) prior to that date were admitted. Accurate figures of the stock on hand, imports and sales are not available, but it is said that the supply met the domestic demand, which is steadily increasing. Prices for *Hevea* Standard Crêpe No. 1, the principal grade, varied from \$0.80 to \$1.04 per one-half kilo [1.1 pounds].

The regulation prohibiting the export of rubber from the Netherlands became effective January 26, 1916. A few shipments to the United States, amounting to \$164,689, were permitted. The exports to that country were valued at \$98,960 in 1915, and at \$534,805 in 1914. It is claimed that 1916 shipments would have been much larger but for the high quotations. American importers preferred to place their orders at the London and Dutch colonial markets, obtaining more favorable prices. Amsterdam brokers say that after the war it will require strong and united efforts to regain the trade of the American market, practically lost through existing circumstances.

Various new rubber factories that are likely to be permanent have been established in Amsterdam and vicinity as a direct result of reduced imports. Among them is a company producing rubber raincoats, other waterproof garments and various kinds of clothing.

NETHERLANDS PLANTATION COMPANIES MOVE.

The following plantation companies have recently moved their offices at The Hague from Kneuterdijk 13 to Bezuidenhout 11, 'S-Gravenhage: Vereenigde Indische Cultuur-Ondernemingen (United Indian Plantations); Nederlandsche Oliepalmen Cultuur-Onderneming (Netherlands Oil Palm Plantations), and Maatschappij Voor Koloniale Ondernemingen (Colonial Plantations Co.)

NETHERLANDS STATISTICAL TAX ON IMPORTS AND EXPORTS.

A statistical tax at the rate of one-tenth per cent ad valorem is now leviable on all goods imported into, or exported from, the Netherlands, in order to defray the expenses connected with a bureau which has been established to compile customs and other national statistics.

BRADFORD ESTABLISHES OFFICE IN PENANG

R. F. Bradford has opened an office in the F. M. S. Railway building at Penang, as general representative in the East of Aldens' Successors, Limited, of London, Liverpool and New York City. The business will be carried on under his own name. Rubber will be the principal commodity dealt in, later other lines of tropical production will probably be included.

THE RUBBER INDUSTRY OF BOLIVIA.

The June issue of the "Pan-American Magazine" is devoted to several articles on Bolivia, a country whose alignment with the United States in the world war stimulates the interest which her developing wealth has aroused during recent years. For years the country has had a favorable trade balance which in 1915 amounted to almost \$30,000,000, chiefly in minerals, although rubber is the principal vegetable product, the 1915 exports of which amounted to 5,081 tons, making Bolivia the second rubber exporting country of South America. All came to the United States except the 341 tons taken by Great Britain.

Bolivian producers in every line are shown to be very prosperous and this is true of the rubber industry, which has benefited greatly as a result of the Madeira-Mamore railroad, completed in 1912, and the improved facilities at Porto Velho on the Madeira river. Interesting facts are included regarding the colonization and development of the 132,000 acres, owned by the Bolivia-Brazil Rubber and Timber Corporation, of which a group of New Jersey men and one Bolivian are officials, Dr. Samuel T. Busey being managing director.

PLANTATION RUBBER IN DUTCH GUIANA.

FUTURE PROSPECTS ENCOURAGING.

UP to the present, apart from the leaf disease which has been epidemic for some time but now seems to be abating, everything points to the fact that rubber growing as a commercial undertaking should be a success.

The rate of growth of the trees in this colony has been satisfactory, and, so far as data can be obtained at this early period, the yield per acre has been quite normal. In some instances it has been above the average. The cost of collecting the latex in some districts has been seven cents per pound of dry rubber. This, possibly, may not be the case when tapping operations have to be carried out on a large scale, and one has to utilize what labor there may be available in the district. It is generally considered that an estate of 300 acres would require about 100 tappers, or one laborer to three acres. This labor force will be required for only about one-third of the day, the remaining two-thirds being devoted to the usual routine of estate work. But it must not be forgotten that, as the trees increase in size, so they increase in the spread of their branches until they so shade the ground that little weeding is actually required. The planter, therefore, will be face to face with the difficulty of disposing of his labor force after tapping has been finished. This is an important feature. If land is available then there is the opportunity of giving out land for the laborers to cultivate in ground provisions, bananas, etc., and, if suitable areas are contiguous, rice planting can be included. The difficulty is a very practical one, as the tapping gangs must be kept on the spot.

If there should be no land adjacent for the laborers to take up, the difficulty of employing a large force can hardly be overcome. It must be borne in mind that in the East it is usual to count the cost of collecting the latex as one-half the total cost of production.

We have, therefore, cause for great hope of the rubber industry, even if the price of rubber should be only 48 cents per pound. Mr. Bancroft, of British Guiana, suggested that the cost of tapping and collecting might be 15 cents per pound, and

the yield that might be expected from trees in full bearing be estimated at 300 pounds per acre, i. e., with rubber at 48 cents per pound, \$144 per acre per annum. As against this, the cost of tapping at 15 cents per pound of dry rubber would amount to \$45 per acre. Taking the experience of the East, that the cost of tapping is half the total expense, we should have an expenditure of \$90, leaving \$54 per acre as a profit. These figures would apply, of course, to an estate in full bearing where very little expenditure for weeding would be necessary. It would seem, therefore, that with rubber at only 48 cents per pound the future may be regarded with some degree of confidence.

MORE SPRAYING NEEDED.

Spraying is a much neglected art in this colony. Even those growers who practice it generally do so in the belief that it may be so much money thrown away. Others practice this method of control merely because they have been compelled to do so by their proprietors, whom, they believe, are all wrong, being guided by scientific men who know really nothing practical about tropical agriculture. The position taken is not unlike that of old sugar planters. When such men as Professor Harrison and Mr. Jermain, both of British Guiana, proclaimed the possibilities of seedling canes, the practical planters in that colony at first would have nothing to do with them; it was the absentee proprietor who forced these canes upon them and who first acknowledged the importance of the work done at the seedling station in Georgetown. The old planters cursed the seedling, but with much grumbling, and still more reluctance, obeyed the instructions of their proprietors. The wisdom of the proprietors to-day speaks for itself in no uncertain voice.

So, too, with spraying. Strong prejudice exists against it, and spraying outfits are often entirely absent on even fairly large estates. Because many planters know nothing about the subject they get no results and jump to the conclusion that all spraying is a fraud. A case in point is the leaf disease of *Hevea Brasiliensis*. Mr. Bancroft has carefully worked out a treatment for this disease and he tells the planter how to spray, what to spray with, and when and how often to apply the application. The planter makes his mixture, possibly makes it incorrectly; he applies it in the wrong way and at the wrong time, and he gets no results. At once he concludes that spraying is useless, that all these scientific instruments only cost money for no purpose, and he condemns in no uncertain terms a system of which he is really entirely ignorant.

It will be seen, therefore, that the whole question of spraying is intimately wrapped up with not only the intelligence of the grower, but his knowledge of certain plant life, and special knowledge sometimes is more than desirable—it is a necessity. In the hands of an ignorant grower spraying may degenerate into a useless and expensive method; in the hands of the man who knows what he is doing it is a most valuable aid to successful rubber growing.

RUBBER EXPORTS FROM ECUADOR.

The exports of rubber for the year 1915 showed a considerable increase over those for 1914, due chiefly to the higher prices paid.

The following figures give the amounts for both years and the countries of destination:

	1914.	1915.
Great Britain	211	708
Germany	40,311
United States	283,413	563,050
Totals	323,935	563,758

Semi-official reports state that 132,000 pounds of crude rubber were exported from the port of Guayaquil during 1916.

BRAZILIAN RUBBER NOTES.

By a Special Correspondent.

THE *Sociedade Nacional de Agricultura*, Rio de Janeiro, lately held a solemn reunion in celebration of the completion of the twentieth year of its existence. José Bezerra, Minister of Agriculture, presided; Lauro Muller, ex-Minister for Foreign Affairs, and the Minister of Chile were among the prominent persons who attended.

This oldest and most important of Brazilian institutions has been untiring in its efforts towards improving and advancing agriculture in Brazil. As a result of its activities, the First and Second Agricultural Congresses were organized and the seeds sown on these occasions bore rich fruit—the creation of the Department of Agriculture, Industry and Commerce. If exhibitions were to be held, the Society was ever ready to take up their management; besides this it constantly arranged for the giving of a series of lectures concerning economic problems.

Through its organ, *A Lavoura*, it circulated propaganda for agricultural matters, and published and distributed articles and works containing much valuable information and advice.

Among its activities for the past year may be mentioned the following points presented for consideration to the Governor and National Congress:

1. Distribution of cotton seed on a large scale and encouragement of cotton culture.
2. Institution of free markets and assistance for those existing.
3. Protection of cotton and study of its diseases and pests, particularly of the Pink Boll Worm.

The list of its members is constantly growing and at present numbers about 6,000 persons.

A CONFERENCE TO PROMOTE RUBBER INTERESTS.

Recently a special commission from Amazonas visited Para with the object of establishing measures for the improvement of commercial relations between the two states.

At the reception held by the *Associação Commercial do Para* and presided over by Dr. Lauro Sodré, Governor of the State of Para, the representatives from Amazonas discussed the question of transport, which has been crippling Amazonian commerce, and pointed out the necessity of steamers putting in at Manaus on their way from Belem to Acre, and *vice versa*. The *Associação* stated that the difficulty lay with the Captain of the Port of Manaus, who persisted in a policy of molestation and persecution toward Para-Acre vessels, and, therefore, proposed that the Silveiro-Enéas law should be abolished, to which the mission replied that the Government of Amazonas would do all in its power to remove the difficulties. Concerning the abolition of the law, however, they recommended that the Governor of Para communicate with the Governor of Amazonas.

The *Associação* also submitted to the special consideration of the heads of both states the following points:

- (1). The organization of co-operative enterprises, one in Para and another in Manaus, for undertaking intensive cultivation of *Hevea* and other cultures in regions near these capitals, the cost of production being thus considerably reduced and the returns proportionately increased.

- (2). Obtaining preferential tariff for manufactures from superior qualities of rubber and an increased duty on articles made of reclaimed rubber or substitutes—a means of encouraging the consumption of good rubber—advancing the valorization and protecting factories where the better kind of rubber is used.

- (3). Inducing the municipalities of the country to enact laws to enforce in electric installations the use of insulated wires of at least 2,500 megohms—thereby necessitating the employment of good rubber.

- (4). Organizing, on an equal basis, an enterprise, directed by the commercial associations of Para and Manaus and under the

supervision of the two governments, to circulate propaganda for rubber in the centers of consumption, representing to industrialists the advantages of utilizing the protection offered by Amazonian tariff, the costs of this enterprise to be covered by the receipts from a tax of 1 per cent on the valorization, to be levied by the Congresses of Para, Amazonas, and, if possible, by Matto Grosso and Federal.

IS THIS NEUTRALITY?

As the *Lloyd Brasileiro* is controlled by the Treasury and, therefore, practically a government department, the preference shown to German shippers at this time is especially incongruous.

Of the 13,098 tons of rubber shipped from Manaus from January 1 to March 30 of the current year to all destinations, 7,298 tons or 55.7 per cent were shipped by Allied and American firms, 4,951 tons or 37.8 per cent by Brazilian and Portuguese firms and only 849 tons or 6.5 per cent by German.

In spite, however, of the enormous disproportion between shipments by Germany and those by Allied and Brazilian firms, out of the total space available in *Lloyd Brasileiro* boats, 47.9 per cent was allotted to Germans, 25 per cent to Brazilian, 17.7 per cent to American—the largest shippers of all—and only 9.4 per cent to all Allied firms, British, French and Italian!

It is hoped that when the Ministry of Finance or of Foreign Affairs is informed of this favoritism, the situation will promptly be altered.

AN EXPERIMENT STATION FOR *HEVEA* CULTIVATION.

The *Club da Seringueira* has recently commenced operations at the *Campo de Experiências da Sociedade Amazonense de Agricultura*. This station had been given over to the government three years ago and all work there was suspended. Dr. Angelino Bevilacqua is the new director, while Colonel Raymundo C. Monteiro da Costa has been entrusted with the task of procuring good seed. The undertaking is financially aided by the government of the State of Amazonas.

Work is now proceeding regularly; *Heveas* have been planted in certain parts of the estate and nursery beds laid out. From April 2 to 24 not less than 42,000 seeds were gratuitously distributed.

THE BALATA INDUSTRY IN SURINAM.

The balata industry during 1916 seems to have been satisfactory. Recent registrations for balata concessions in Paramaribo also indicate a certain amount of activity.

The exports for the year amounted to 2,005,278 pounds, which compares the more favorably with the British Guiana figures of 1,450,702 pounds, because labor in Surinam is scarce, while the neighboring colony can command sufficient men to meet its needs. About 253 tons of balata, representing a value of about \$300,000, arrived in Nickerie during the past year.

The balata production for the last six years was: 1911, 1,146 tons; 1912, 727 tons; 1913, 1,086 tons; 1914, 1,086 tons; 1915, 209 tons; 1916, 769 tons.

The recovery of this industry during the last year has naturally been greeted with much satisfaction, especially because of its influence on the general business tone in the colony. However, the labor situation, which is becoming acute, is causing considerable anxiety, as does the shipping question, making it difficult for merchants to send their products to the highest bidders.

EXPORT DUTY ON YAVARI RUBBER.

A Peruvian Presidential Decree of December 27, 1916, provides that the duties (2, 4 and 6 per cent) imposed by a decree dated July 12, 1916, are to be levied on the market prices of rubber from the Yavari. By this new decree the reduction of 30 per cent from the current prices allowed on rubber from the Madre de Dios is not to be allowed for rubber from the Yavari.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED MAY 15, 1917.

- N** 1,225,910. Pneumatic tire. J. F. Chauvin, assignor to C. P. Jones—both of Houna, La.
- 1,225,911. Tire filler. T. A. Sprague, Pittsburgh, Pa.
- 1,225,910. Tire valve unseating device. W. A. Williams, Barton, Ohio.
- 1,226,100. Rubber tire and its attachment and detachment to and from wheels. E. B. Killen, London, England.
- 1,226,110. Airless tire. L. H. Patterson, Portland, Oreg.
- 1,226,148. Diving dress. F. H. Walters, Auckland, New Zealand.
- 1,226,247. Rubber tread surface for boots. J. D. Prince, New York City.
- 1,226,254. Non-skid tire. A. Rich, Stamford, Conn.
- 1,226,270. Tire clamp. L. E. Snivley, Jr., Glenside, Pa.
- 1,226,271. Tab end for garters. H. J. Stuart, assignor to The Robert N. Bassett Co.—both of Derby, Conn.
- 1,226,304. Water bag stopper. H. V. Brumley, Plandome, assignor to Whitall Tatum Co.—both of New York City.
- 1,226,318. Rubber-soled canvas shoe. E. W. Dunbar, assignor to Apsley Rubber Co.—both of Hudson, Mass.
- 1,226,320. Tire chain. T. V. Elliot, New York—assignor to Elliot Rim Chain & Tread Corp., Esopus—both in New York.
- 1,226,358. Tire tread. Mabelle Nace, Piedmont, Calif.
- 1,226,563. Tire valve. H. F. Miller, Rushville, Nebr.
- 1,226,580. Tire. E. J. Oetter, Denver, Colo.
- 1,226,596. Pressure bag for vulcanizing purposes. H. E. Rasmussen, Fitchburg, Mass.

ISSUED MAY 22, 1917.

- 1,226,664. Tire valve. W. R. Hose, New Ulm, Minn.
- 1,226,702. Vacuum massage device. J. G. Schleiter, Toledo, Ohio.
- 1,226,703. Pneumatic tire. K. H. Schmidt, Chicago, Ill.
- 1,226,862. Antislipping device for armored pneumatic tire. C. L. Crow, Alexander City, Ala.
- 1,226,899. Tire filler comprising a circumscribing strip and resilient disks through which the strip passes. L. McKinnon, Salt Lake City, Utah.
- 1,226,909. Blowout patch. B. H. Pratt, Milwaukee, assignor to The Federal Rubber Co., Cudahy—both in Wisconsin.
- 1,226,984. Rubber covered roller. J. Muskett, Pendleton, Manchester, England.
- 1,227,011. Tire rim detacher. T. R. Snyder, assignor of one-fourth to W. H. Werley—both of Barberton, Ohio.
- 1,227,108. Inner tube for pneumatic tires. H. C. Boggs, Decatur, Ala.
- 1,227,239. Protecting lining for pneumatic tire. Bertha Mermelstein, New York City.
- 1,227,422. Core for resilient wheel tires. G. E. Gilmore, Cleveland, and V. F. Roessel, Akron—both in Ohio.
- 1,227,426. Tire casing. H. E. Grabau, Long Island City, and A. C. Schwartz, New York City—both in New York; said Grabau assignor to said Schwartz.
- 1,227,493. Resilient heel for boots or shoes. A. L. Runyan, Waterloo, Iowa, assignor to Runyan Cushion Wheel Co., Omaha, Nebr.
- 1,227,494. Resilient wheel. A. L. Runyan, Waterloo, Iowa, assignor to Runyan Cushion Wheel Co., Omaha, Nebr.
- 1,227,495. Resilient tire. A. L. Runyan, Waterloo, Iowa, assignor to Runyan Cushion Wheel Co., Omaha, Nebr.
- 1,230,075. Demountable rim. L. H. Perlman, New York City.

ISSUED MAY 29, 1917.

- 1,227,563. Pressure gage attachment. W. A. Allen, Yonkers, assignor to A. Schrader's Son, Inc., Brooklyn—both in New York.
- 1,227,673. Armored liner for pneumatic tires. S. A. Ruse, Chicago, Ill.
- 1,227,690. Hose. L. A. Subers, Cleveland, Ohio.
- 1,227,791. Tire for vehicles and method of making the same. J. Huebner, assignor to Pan-American Rubber Co.—both of Milwaukee, Wis.
- 1,227,925. Demountable rim for pneumatic tire. E. Oliver, Dayton, Fla.
- 1,227,990. Demountable rim wheel. E. K. Baker, assignor to Universal Rim Co.—both of Chicago, Ill.
- 1,228,001. Rubber tire casing having corrugated metallic armor plate embedded therein. D. J. Demar, Pittsburgh, Pa.
- 1,228,071. Inner tube comprising a plurality of inflatable sections, and an air distributing tube extending through them. J. F. Sincage, Florence, Mass.
- 1,228,140. Rubber bottle-washing brush. M. C. Rosenfeld, Boston, Mass.
- 1,228,246. Demountable rim. J. D. Reilly, Providence, R. I.
- 1,228,346. Removable resilient core for tires. J. W. Moakles, assignor of one-half to N. S. Wright—both of East Worcester, N. Y.
- 1,228,355. Vehicle tire jacket. A. S. Anderson, assignor of one-half to R. L. Smith—both of Oakland, Calif.

ISSUED JUNE 5, 1917.

- 1,228,397. Canvas hose coupling. N. B. Braly, Butte, Mont.
- 1,228,447. Tire shield. L. Koenig, New York City.

- 1,228,528. Laminated power transmission belt. M. D. Campbell, assignor to The Perkins Campbell Co.—both of Cincinnati, Ohio.
- 1,228,532. Vocal flute constructed in a single piece from rubber. A. V. Chevers, East Providence, R. I.
- 1,228,539. Resilient tire. J. V. Dewald, Philadelphia, Pa.
- 1,228,630. Tire body construction. P. E. Wirt, Bloomsburg, Pa.
- 1,228,650. Protected tire. J. H. Christian, Detroit, Mich., assignor to Perfection Tire & Rubber Co., a corporation of South Dakota.
- 1,228,783. Air mattress. G. E. Kerivan, Newton, Mass.
- 1,228,795. Means for holding demountable rims on wheels. S. R. McKay, assignor to The McKay Co.—both of Cleveland, Ohio.
- 1,228,796. Rim-clamping device. S. R. McKay, assignor to The McKay Co.—both of Cleveland, Ohio.
- 1,228,808. Corset having elastic strips. M. G. Motz, Hillsdale, N. J.
- 1,228,884. Rubber boot with side pocket pac. J. T. Crowley, assignor to The Beacon Falls Rubber Shoe Co.—both of Beacon Falls, Conn.
- 1,228,914. Inflatable apparatus for raising sunken ships. E. S. Hayford, New Orleans, La.
- 1,228,941. Demountable rim. E. R. Maurer, Detroit, Mich.
- 1,228,970. Wheel rim. James T. Donald, Seattle, Wash.
- 1,229,050. Respirator. R. Donald, London, England.
- 1,229,096. Reinforcing device for pneumatic tires. E. J. Kries, Mendota, Ill.
- 1,229,104. Tire protector. L. H. Lloyd, Bloomington, Ill.
- 1,229,166. Resilient tire. S. Suss, New York City.
- 1,229,245. Fire-hose valve. W. H. Eddy, Superior, Wis.
- 1,229,264. Pneumatic tire. V. Hensley, Vallejo, Calif.
- 1,229,270. Waterproof cloak. F. W. Howard, New York City.
- 1,229,423. Drainage appliance. E. G. Eckenrode, Baltimore, Md.
- 1,229,581. Means for attaching a resilient cushion to a rigid base. R. Butler, Boston, Mass.
- 1,229,639. Demountable and separable vehicle-wheel rim. H. Mote, Cleveland, Ohio.
- 1,229,734. Means to deflate inner tubes. H. N. Eversole, H. R. Cawthon, and H. I. Owen, Fulton, Mo., said Cawthon and said Owen assignors to said H. N. Eversole and F. R. Eversole, St. Louis, Mo.
- 1,229,794. Illuminated toy balloon and lighting effect. A. Salzer, New York City.
- 1,229,801. Demountable rim for vehicle-wheels. A. H. Smith, New York City.
- 1,229,861. Puncture-proof pneumatic tire. G. Auberlin, Vallejo, Calif.
- 1,229,947. Athlete's guard comprising elastic adjusting straps. F. Haggerty, assignor of one-fourth to C. Izenstark—both of Chicago, Ill.
- 1,230,007. Rubber-lined combination valve and hose connection. F. Milliken, Lawrence, N. Y.
- 1,230,019. Hose-band. O. W. Patton, Los Angeles, Calif.
- 1,230,025. Pneumatic belt and back and shoulder pads for use in carrying personal equipment. J. A. Pugh, Cardiff, Wales.
- 1,230,071. Pneumatic tire alarm device. L. E. Hawk, assignor of one-third to E. R. Kilpatrick—both of Chicago, Ill.
- 1,230,075. Demountable rim. L. H. Perlman, New York City.

THE UNITED KINGDOM.

ISSUED MAY, 9, 1917.

- 102,039. Spout for collecting rubber latex from trees. J. H. Beaufort, British North Borneo.
- 104,484. A clip for securing a rubber tube to a metal pipe. A. G. Elliott and Rolls-Royce, Limited, Nightingale Road, Derby.
- 104,529. Tire patch. C. L. Cuthbe and E. D. Burley (trading as C. L. Cuthbe & Co.), 37 Great Eastern street, London.
- 104,536. Soft india rubber slipper for insertion between a porcelain tooth and the dental plate. E. R. Magnus, 175 Macquarie street, Sydney, New South Wales, Australia.
- 104,615. Rubber corn shields. C. W. Doubleday, 141 Maple street, Ashland, Ohio, U. S. A.
- 104,616. Combination leather and rubber shoe sole. F. Marsh, 77 Cross Green Lane, Leeds.
- 104,820. Rubber-soled shoes. W. J. Jackson, Mellersh, 28 Southampton Buildings, London. (National India Rubber Co., Wood street, Bristol, Rhode Island, U. S. A.)
- 104,868. Diving apparatus. Dragerwerk, H. & B. Drager, 53 Moislinger Allee, Lubeck, Germany.

ISSUED MAY 16, 1917.

- 104,891. Means for automatically distributing the load to motor car wheels. W. T. Carling, Tangley, Sydney Road, Guildford.
- 104,903. Sewing machine presser foot comprising a rubber ring. L. R. Jenkintown, Pennsylvania, U. S. A.
- 104,926. Pneumatic tire pressure gage. E. C. R. Marks, 57 Lincoln's Inn Fields, London. (Vancouver Motor Supplies, 827 Hastings street west, Vancouver, British Columbia, Canada.)
- 104,980. Fountain pens. W. I. Ferris, 525 Lawrence avenue, Westfield, New Jersey, U. S. A.

- 104,983. Inflatable life-saving garment. H. Swinbourne, 8 Duke street, Hoxley, near Barnsley, Yorkshire, and G. H. Welford, 64 Cumberland street, North Road, Darlington.
- 104,992. Soft rubber suction base for lower dentures. A. W. Fisher, Bryn Estyn, Whitchurch, Salop.
- 104,997. Tire attachments to rims. G. S. Warin, Abbey Lane, Stratford, Essex.
- 105,038. Surgical drainage appliance of rubber. J. A. Liddell, 358 High Road, Lee, Kent.
- ISSUED MAY 23, 1917.
- 105,126. Elastic tires. J. F. van der Velde, 12d Bezuidenhout street, Troyeville, Johannesburg.
- 105,159. Drain plug comprising a rubber ring. J. Heath, Manor avenue, Umston, near Manchester.
- 105,169. Soothing teats. W. T. Rae, 2 Royal Terrace, Springburn, Glasgow.
- 105,214. Sleeves of coats and waterproof garments. B. M. Chambers, H. M. S. Impériale, care of General Post Office, London.
- 105,215. Couplings for rubber or like hose. J. J. Purdie, Dunavon, Lansdown Road, Sidcup, and Leyland & Birmingham Rubber Co., Golden Hill Works, Leyland, Lancashire.
- 105,226. Printing surfaces made by pressing plates of plastic material, such as rubber, on to a matrix. H. Blucher, 1 Kanalstrasse, Gohlis, Leipzig, and E. Krause, 6 Sedanstrasse, Steglitz, Berlin, both in Germany.
- 105,229. Dust caps for tire valves. A. Schrader's Son, 783 Atlantic avenue, Brooklyn, New York, assignee of M. C. Schweinert, 226 Palisade avenue, West Hoboken, and J. Volckhausen, 54 Fulton street, Weehawken—both in New Jersey.
- 105,238. Protected pneumatic tire. R. de Prandieres, 2 Rue Duquesne, Lyons, France.
- 105,260. Patch for repairing tire tubes. W. C. Sneyd, 144 Broad Street, Pendleton, and H. E. Young, 32 Broadway, Withington—both in Manchester.
- 105,293. Artificial foot having rubber cushion. C. Salmon, 55 Drayton Park, Highbury, London.
- 100,498. The word DRIDEK—waterproofed textile fabrics for tops, curtains, and upholstery for automobiles and other motor vehicles. L. J. Mutty Co., Boston, Mass.
- 101,216. Design of four-leaved clover within a square frame—men's rain-coats. Roger Bros., Chicago, Ill.
- 102,155. The words GOOD AS WHEAT—rubber tires. Converse Rubber Shoe Co., Malden, Mass.
- 102,191. The word CUPID—chewing-gum. Love-Me-Gum Co., Baltimore, Md.
- 102,503. The words THE BOOTERY—boots, shoes, and slippers made of leather, rubber or canvas. C. H. Wolfelt Co., Los Angeles, Calif.
- 102,983. The compound word EX-O-DENT—chewing-gum. Detroit Dental Manufacturing Co., Detroit, Mich.
- 103,047. Design of leaves and blossom with letter C in center—chewing-gum. Independent Gum Co., Kansas City, Mo.
- 103,098. Horizontal design of leaves and blossom with letter C in center—chewing-gum. Independent Gum Co., Kansas City, Mo.
- 103,099. Perpendicular design of leaves and blossom with letter C extending above it—chewing gum. Independent Gum Co., Kansas City, Mo.
- 103,182. The word TUXEDO—suspenders. Pioneer Suspender Co., Philadelphia, Pa.
- 92,831. The word SEACO—hot water bottles, syringes, ice caps, invalid rings, surgical rubber gloves, breast pumps, and atomizers. Geo. L. Clafin Co., Providence, R. I.
- 97,449. The word WEAREVER—household rubber gloves. The Faultless Rubber Co., Ashland, Ohio.
- 102,569. Six-pointed design within a circle—rubber tires. The Miller Rubber Co., South Akron, Ohio.
- 102,676. The words JUICY FRUIT within a design—chewing gum. Wm. Wrigley, Jr., Co., Chicago, Ill.
- 102,718. The words FIRST STEP—leather, rubber and canvas shoes. Mrs. A. R. King, Inc., Philadelphia, Pa.
- 103,069. The word SUPERBAR—rubber tires. Rubber Insulated Metals Corp., Richmond, Va., and Plainfield, N. J.
- 103,461. The word BEACON—rubber heels and rubber soles. Beacon Rubber Co., Lynn, Mass.
- 84,473. Representation of an athlete—boots and shoes made partly or wholly of rubber, namely, rubber-soled shoes with canvas uppers vulcanized or cemented thereon. The Beacon Falls Rubber Shoe Co., Beacon Falls, Conn., assignor to The Beacon Falls Rubber Shoe Co., Boston, Mass.
- 84,474. The word MARATHON—boots and shoes made partly or wholly of rubber, namely, rubber-soled shoes with canvas uppers vulcanized or cemented thereon. The Beacon Falls Rubber Shoe Co., Beacon Falls, Conn., assignor to The Beacon Falls Rubber Shoe Co., Boston, Mass.
- 101,422. The word ZEPHYR—play-balls. The Gregory Rubber Co., Akron, Ohio.
- 102,518. The words SILVER KING BLACK LINE—golf-balls. The India Rubber, Gutta Percha & Telegraph Works Co., Limited, London, England.
- 102,519. The words SILVER KING RED LINE—golf-balls. The India Rubber, Gutta Percha & Telegraph Works Co., Limited, London, England.
- 102,520. The words SILVER KING GREEN LINE—golf-balls. The India Rubber, Gutta Percha & Telegraph Works Co., Limited, London, England.
- 102,521. The words SILVER KING YELLOW LINE—golf-balls. The India Rubber, Gutta Percha & Telegraph Works Co., Limited, London, England.
- 102,687. The letter M within a shield design—floor-gaskets, siphon-valve washers, fuller balls, valve-disks, and glass-gage washers made of rubber or rubber and fabric. The Mechanical Rubber Co., New York City.
- 103,015. The word INDESTRUCTIENE—rubber belting, rubber water-hose, garden-hose, cotton rubber-lined milled hose, cotton rubber-lined fire-hose, rubber fire-hose, steam-hose, brewers' hose, oil-hose, air-hose, acid-hose, sand-blast hose, suction-hose, dredging-sleeves, sheet-rubber packing, and rubber gaskets. The Combination Rubber Manufacturing Co., Bloomfield, N. J.

THE DOMINION OF CANADA.

ISSUED FEBRUARY 28, 1917.

- 174,865. Rubber soled shoe. L. C. Colt, Bristol, Rhode Island, U. S. A.
- 174,880. Inner tire. J. H. Grube, Los Angeles, California, U. S. A.
- 174,926. Non-skid tire. A. Rich, Stamford, Connecticut, U. S. A.
- 174,932. Protector for pneumatic tires. J. W. Smith, Nooksack, Washington, U. S. A.
- 174,993. Teat cup. H. W. Terry and J. W. Fowler—both of Toronto, Ontario.
- 175,003. Canvas hose coupling. N. B. Braly, Butte, Montana, U. S. A.
- 175,027. Teat cup for milking machines. L. Dinesen, Minneapolis, Minnesota, U. S. A.
- 175,044. Inflatable life saving belt. T. Ingaramo, Genoa, Italy.
- 175,144. Nursing bottle and nipple. H. H. Baker, assignee of R. R. Baker—both of Buffalo, New York, U. S. A.
- 175,352. Automobile tire. I. Normandy, St. Catharines, Ontario.

THE FRENCH REPUBLIC.

PATENTS ISSUED (WITH DATES OF APPLICATION.)

- 482,308 (July 21, 1916). Rubber cushion wheel. G. Costantin.
- 482,367 (July 26, 1916). Improvements in pneumatic tires. H. Brown.
- 482,373 (September 3, 1915). Pneumatic metallic wheel for automobile and other vehicles. C. Longest (Sr.).
- 482,519 (August 8, 1916). Double inner tube. N. C. Doss.
- 482,609 (August 21, 1916). Pneumatic tire. A. Baigné.
- 482,615 (August 21, 1916). Method of fitting solid tires to the rims of wheels. C. Videcoq.
- 482,620 (August 21, 1916). Improvements in rims and tires for wheels. H. Raňovich.
- 482,660 (August 26, 1916). Elastic wheel for vehicles. C. Weber and M. W. Gerth.
- 482,682 (August 28, 1916). Improvements in tires for wheels of vehicles, automobiles and others. A. A. Crozier.
- 482,683 (August 28, 1916). Tire for wheels of carriages, automobiles and others. A. A. Crozier.

TRADE-MARKS

THE UNITED STATES.

- 100,614. Representation of sticks forming the word STYX—rubber patch for repairing inner tubes of automobile tires. H. E. Dickard, Monroe, La.
- 101,259. The word FARNUM intertwining a curved dagger—men's, women's and children's shoes made of rubber and other materials. Churchill & Alden Co., Brockton, Mass.
- 101,394. Representation of a section of belting with a blue stripe through the center—rubber belting. The Goodyear Tire & Rubber Co., Akron, Ohio.
- 101,470. The word YUCATAN—chewing gum. American Chicle Co., New York City.
- 101,779. The word CERVANTES—fountain pens. Celestino Fernandez & Sons, New York City.

- 102,248. The word SQUARE above the word DEAL—rubber bands. Goodyear Rubber Co., St. Paul, Minn.
- 102,455. The compound word BEE-GEE-BOO—balloons. The Miller Rubber Co., Akron, Ohio.
- 86,469. The word CHEF and below it a representation of a French cook—chewing-gum. Berdan & Co., Toledo, Ohio.
- 99,858. Representation of a man's foot in the act of walking, displaying heel—rubber heels for boots and shoes. O'Sullivan Rubber Co., Portland, Me., and New York City.

THE UNITED KINGDOM.

- 376,925. The word BELDAMITE—compositions for preventing the radiation of heat. The Beldam Packing & Rubber Co., Limited, 29 Gracechurch street, London, E.C.3.
- 376,331. The word MULTIBESTOS—all goods included in class 40. Standard Woven Fabric Co., South street, Walpole, Massachusetts, U. S. A. United Kingdom address, care of Marks & Clerk, 57 and 58 Lincoln's Inn Fields, London, W.C.
- 377,518. The word MAXIMILE—all goods included in class 40. Redfern's Rubber Works, Limited, Dawson street and Spring Bank street, Hyde, Cheshire; and 10 Gresham street, London, E.C.2.
- 376,752. The word IRIS—india rubber teats for feeding bottles, sold separately, i. e., apart from the bottles themselves. J. G. Franklin & Sons, Limited, 17 Colveston Crescent, Dalston, London, E.8.
- 376,926. The word BELDAMITE—raw or partly prepared vegetable, animal, and mineral substances used in manufacture not included in other classes. The Beldam Packing & Rubber Co., Limited, 29 Gracechurch street, London, E.C.3.
- 376,935. The word BELDAMITE—all goods included in class 40. The Beldam Packing & Rubber Co., Limited, 29 Gracechurch street, London, E.C.3.
- 377,110. The word SPHINX—electric insulators of india rubber and gutta percha. H. G. Longford, W. W. Longford, and W. A. Clark, trading in co-partnership, 240-242 Bradford street, Birmingham.
- 377,646. The word CONDOR—india rubber machine belting and belting made partly of india rubber and partly of fabric included in class 40. The Manhattan Rubber Manufacturing Co., 120 Broadway, New York City. Address for service in the United Kingdom is, care of A. E. White, 88, 89 and 90 Chancery Lane, London, W.C.2.

Review of the Crude Rubber Market.

Copyright, 1917.

NEW YORK.

THE crude rubber market has been extremely dull during the entire month of June, a condition that is usually expected at this time of the year when the mills, as a rule, slow down for the summer. Arrivals for the past six weeks have been extremely heavy particularly at the Pacific ports. All of these shipments that have arrived are for the most part overdue rubber consignments to manufacturers who were thereby well supplied and not interested in nearby rubber. This left considerable stocks in dealers' hands, resulting in heavy liquidation that was the cause of the steady downward trend of values during the month. Later, however, an active interest developed in futures and substantial orders were placed by the manufacturers when the quotation of 64 cents was fairly well established for all positions covering the most part of 1918.

The price of plantation rubber has declined 15 cents and Upriver fine 5 cents a pound since June 1 when First latex crêpe and Smoked sheet ribbed spot were selling at 80 cents, and future positions of First latex crêpe and Smoked sheet ribbed were, July-September, 77 cents, October-December, 75 cents. Upriver fine was quoted 74 cents in an easy market, Upriver coarse 53 cents, Upper caucho ball 50½ cents, and Cameta 38 cents. Africans were dull and uninteresting with Prime black Congo in fair demand at 64 cents. Accra and Niger flake were both easy at 31 cents. Centrals had a limited demand with Esmeralda sausage at 52 cents, and Central scrap at 51 cents. As the month progressed with substantial arrivals of contract rubber, the holders of spot and nearby were forced to sell and the market continued to decline. On June 28 First latex crêpe and Smoked sheet ribbed, spot were 65½ cents, with 64 cents quoted for all positions in 1918. Paras were 3 to 4 cents higher in Para than in this market when Upriver fine was quoted 69 cents, Upriver coarse 49 cents, Upper caucho ball 44 cents, and Cameta 34 cents. Africans were dull and unchanged in price while Centrals had developed nothing interesting and prices had declined about 6 cents a pound.

Due to the efforts of the Legislative Committee of the Rubber Association, the proposed war tax of 10 per cent on crude rubber has been struck out of the War Revenue Bill now before Congress.

LONDON.

The report of a tax to be levied on American imports of crude rubber resulted in considerable buying on the part of dealers and served to strengthen the market early in the month. Later it was rumored that there was small possibility of this duty being imposed and the market weakened. Quiet conditions generally prevailed throughout the month and later developed positive dullness. The absence of all important buying interests was pronounced, strongly reflecting the position of the New York market. The situation here is generally accepted as resulting from the heavy shipments that have gone to America during the past six weeks and quiet times are looked for until replacements are required. Plantation rubber prices have declined about 7d. during the month just passed. On June 1 Standard crêpe and Ribbed smoked sheets were both quoted a farthing less than 36d. with July-December deliveries at 36d. The spot market continued to steadily decline until June 28, when prices stiffened somewhat and Standard crêpe closed at 30½d. and Rihs at 29½d., with futures holding very much higher than spot, an unusual market condition.

London and Liverpool imports for April were 10,000 tons compared to 8,780 tons for March. Re-exports for April were 8,200 tons against 4,059 tons for March.

SINGAPORE.

The shipping situation and the difficulties in negotiating drafts continue to harass the movement of shipments from this port. The market for the past month has been quiet and for the most part dull with principal attention centered on Rihs. At the auctions held in Singapore, June 1, 9, 16 and 23, the following average prices were realized: First latex crêpe 59.7 cents, compared to 65.36 cents last month; Smoked sheet ribbed, 60.19 cents, compared to 65.36 cents last month. The total amount sold was 1,549 tons, compared to 2,618 tons sold a month ago.

COMPARATIVE NEW YORK PRICES FOR JUNE.

The following table, furnished by Messrs. Albert E. Leeds, Broker in crude rubber, 100 Broadway, New York, and No. 68 William Street, New York, advises as follows:

"The demand for paper has continued very light through June, New York City banks being almost entirely out of the market, and out-of-town ones buying lightly. The best rubber names have been quoted at 5½¢ to 6 per cent, and even higher for those not so well known."

	1917.	1916.	1915.
Latex, fine	61 a 76	61 a 75	61 a 73

WEEKLY RUBBER REPORT.

GUTHRIE & CO., LIMITED, Singapore, report [May 10, 1917]:

The weekly rubber auction opened yesterday with a steady demand at prices, for the leading grades, averaging about \$2 per picul below last week's. Ribbed smoked sheet and fine pale crêpe both sold up to \$154 per picul. Prices fell away a little during the day, but revived at the continuation of the sale this morning, when \$155 was paid for two lots of ribbed smoked sheet. The top prices were lower than those of last week's auction by \$1 in the case of sheet and \$3 in the case of crêpe. Of unsmoked sheet there was only a small quantity on offer, and prices were about \$8 down. Brown and dark crêpes met with a brisk demand at good prices, but the demand fell away towards the end of the sale. Of 985 tons catalogued, 476 tons changed hands.

The following was the course of values:

	In Singapore per Picul.*	Sterling Equivalent per Pound in London.	Equivalent per Pound in Cents.
Sheet, fine ribbed smoked.....	\$150@155	3/ @ 3/ 1	63.75@65.87
Sheet, good ribbed smoked.....	135@149	2/ 8 7/8 @ 2/ 11 3/4	57.37@63.32

JUNE 27, 1917.

Prices subject to change without notice.

THE MARKET FOR RUBBER SCRAP.

NEW YORK.

MECHANICALS. There has been some business doing in this material, garden hose being the feature of the list with air brakes and cotton fire hose following. Prices have advanced about ½ cent on these grades since last month. The same easier conditions prevailed with mechanicals that have characterized all the other sorts of rubber scrap during the last week of the month. London and Liverpool imports of waste and reclaimed rubber for April were 167,300 pounds, compared to 114,600 pounds for March. Re-exports for April were 22,300 pounds, against 55,900 for March. London and Liverpool exports of waste and reclaimed rubber manufactures of the United Kingdom for April were 1,062,300 pounds against 815,300 pounds for March.

NEW YORK.

BARYTES. This material has not been particularly active and spot supplies have been freely offered at unchanged prices. Foreign grades are limited with prices nominal.

CARBON BISULPHIDE had considerable call and found the market short in some quarters, resulting in marking up prices about 3 cents a pound.

DRY COLORS. Business in rubber colors has been good, red oxide going particularly well. The blacks show no change, and the price undertone for the entire list is particularly firm.

LITHOPONE. The producers are in a favorable position to maintain sufficient supplies of this material for the time at least. Delivery on contracts are being regularly made and prices remain unchanged.

LEAD PIGMENTS. The strong position of the raw material has advanced prices of all lead pigments since a month ago. The market is firm and holders are not anxious to sell at present levels on account of the prevailing uncertainty surrounding the future supply.

SULPHUR FLOUR. The market is very strong and another price advance has been made. Velvet brand, in carloads, is now quoted \$3.90 per hundredweight.

WHITING. The limited arrivals of chalk are not sufficient to meet the continued demand for whiting. The market is strong and prices have advanced, although quotations are considered nominal and subject to agreement between the buyer and seller.

ZINC OXIDE. New prices on American process zinc oxide for future contracts covering delivery over the second half of the year show an advance of $\frac{1}{2}$ cent a pound over last month's quotations. French process contracts for the third quarter of the year are unchanged. The speculative market for spot zinc oxide in second hands is much higher than contract prices. Sales have been reported at 16 cents during the month.

THE MARKET FOR COTTON AND OTHER FABRICS.

Copyright 1917.

NEW YORK.

AMERICAN cotton experienced a series of sensational price advances during the past month as the result of scarcity of stocks and a persistent demand. On June 1, spot middlings were 22.65 cents, with December futures at 22.01 cents. June 26, spot middlings were 27.15 cents and December futures 26.58 cents. This persistent bull movement was due to the acute state of the Liverpool market resulting from the steadily diminishing holdings of American cotton and the inability to replenish stocks through lack of shipping facilities. The suspension of business in futures on the Liverpool Cotton Exchange and the closing of the Havre cotton market soon followed. There is little apprehension felt that similar measures will be adopted on this side, as the situation is entirely different. Liverpool is a distinctly consuming market and being isolated from the sources of supply is temporarily prevented from receiving stocks by shortage of carriers.

EGYPTIAN COTTON. The first direct shipment of Egyptian cotton from Alexandria, consisting of 15,000 bales valued at \$7,500,000, was discharged at Boston early in the month. The S.S. *Elele* on which this cargo arrived, was torpedoed on the return trip. It is reported there are still 20,000 bales of the present crop held in Egypt or England for the account of local buyers. As our importations are 200,000 bales yearly, these shipments would, if delivered, be a comparatively small matter; moreover, they are all for contract delivery. There is, however, some relief promised by the Textile Alliance recently formed that will cooperate with the British Government to release Egyptian cotton under guarantees similar to those of the Rubber Association. The cotton will be cleared in private invoices and delivered to the fumigation plants in bond.

SEA ISLAND COTTON. The Charleston and Savannah markets are closed for the season as the crop has all been marketed and sold. The new crop will not come to market before October. The crop in all three states is reported to be doing well, although about two weeks backward; however, it is too early to make definite forecast of the final outcome.

TIRE FABRICS. The tire fabric producers have been called on by the government for about 25 per cent of their capacity to be used in the production of army duck. This will obviously reduce tire loom capacity and, if protracted, may cause a shortage in tire fabrics. While the demand has been quiet during the past month in some quarters, it was reported in others that buying had been renewed. Contract deliveries, however, have been regularly called for by the consuming trade.

It is understood that Peeler fabric, strictly speaking, is made from 1 1/8 to 1 7/16-inch staple, although 1 1/16-inch staple is often the minimum. Peeler yarns have a high tensile strength

and in quality would doubtless prove a satisfactory substitute for the standard grades, but the total production of only 50,000 bales is insufficient.

Both combed and carded Peelers have been in extraordinary demand and as a result prices show an advance of 10 to 15 cents during the month. That the large consumers and producers of tire fabrics are well balanced as to requirements until the first of the year is generally conceded.

DUCK, SHEETINGS, DRILLS, OSNABURGS. The government's call for 50,000,000 yards of 12-ounce army duck has greatly strengthened the market, resulting in a strong demand from the regular consuming trade and a material price advance in the entire list. The loom capacity of the mills has been strained to take care of government orders that have precedence over all others. Hose and belting duck have been active, with 52 cents quoted on both grades, an advance of 10 cents a pound since a month ago, and mills are sold up to April of next year. Sheetings are scarce at purely nominal prices while drills and enameling duck are well sold into next year. Prices have advanced about 5 cents for drills and 3½ cents for enameling duck since our last report.

TO STANDARDIZE COTTON TESTING METHODS.

THE convention of the American Cotton Manufacturers' Association in Washington last May was considered an opportune time to call a special meeting of Committee D-13 of the American Society for Testing Materials. This was held at Hotel Powhatan, with William D. Hartshorn, chairman of that committee, presiding. The rubber trade was represented by A. E. Jury, United States Rubber Co., New York City; J. W. Cooper, Firestone Tire & Rubber Co., Akron, Ohio; A. E. Warner and C. H. T. Warner, Miller Rubber Co., Akron, Ohio; George W. Skirm, United & Globe Rubber Manufacturing Cos., Trenton, New Jersey; E. H. Barnwell, Goodyear Tire & Rubber Co., Akron, Ohio; Robert W. Boys, Goodyear Cotton Mills, Goodyear, Connecticut, and the textile manufacturers included C. S. Cook, J. Spencer Turner Co., New York City; William O. Jelleme, Brighton Mills, Passaic, New Jersey; C. B. Finckel, J. H. Lane & Co., New York City; Kenneth Moller, William Whitman Co., Inc., Boston, Massachusetts; George Fish, Jenckes Spinning Co., Pawtucket, Rhode Island; Henry L. Scott, H. L. Scott & Co., Providence, Rhode Island. Others present included Walter S. Lewis and E. Dean Walen of the Bureau of Standards, Washington, District of Columbia; George B. Haven, Massachusetts Institute of Technology, Cambridge, Massachusetts; and John Lind of the United States Navy Department, Washington, District of Columbia.

Tentative methods for testing cotton fabrics were considered, preparatory to discussion at the meeting held at Atlantic City in June. Two sub-committees were appointed, of one of which A. H. Clarke is chairman, to consider suggestions made at the meeting, to report with recommendations later; and the other, of which Dr. S. W. Stratton is chairman, to investigate ways and means to harmonize methods of testing fabrics throughout the cotton industry in this country and to consider ways for giving these methods publicity.

COTTON TRADE NOTES.

THEODORE WOOD, a recognized authority on cotton goods, and formerly fabric manager of the Goodyear Tire & Rubber Co., has become associated with the R. J. Caldwell Co., New York City, selling agent for the Connecticut Mills Co.

A new cotton mill, called the Penrod Mills, now being erected at New Bedford, Massachusetts, to care for the spinning requirements of the Passaic Cotton Mills, will be in operation next Fall.

Charles S. Underwood, who recently went to Rotch Mills, New Bedford, Massachusetts, as assistant to Manning Emery, Jr., has been placed in charge of the New Bedford Spinning Co. department of the Passaic Cotton Mills, which controls both this and the Rotch plant.

It is reported that a three-story brick mill construction building is being built as an addition to the plant of the Westerly Textile Co., Westerly, Rhode Island, manufacturer of tire fabrics.

The Turner, Halsey Co., T. J. Hallyburton department, has been appointed selling agent for the Conestee Mills, Greenville, South Carolina. The mills manufacture sheetings and drills, with an equipment of approximately 20,300 spindles and 413 looms.

They have also recently taken over the product of the Panola Cotton Mills, Greenwood, South Carolina, with 17,500 spindles and 400 looms.

TABLE OF CONTENTS ON LAST PAGE OF READING.**FORTY MILLION HEVEAS IN THE PHILIPPINES.**

FORECASTING the future is a fascinating employment, and the crude rubber situation is a very tempting field in which to let one's fancy wander. Therefore not to prophesy but just to imagine, suppose England were obliged to put an export duty of 20 cents a pound on her plantation rubber, it would cost the rubber trade of the United States say \$25,000,000 a year. Suppose that Holland, having suffered cruelly through the war, also imposed a tariff of 20 cents a pound. It would cost American manufacturers \$4,000,000. Moreover, suppose the powers that be at Washington put, say, 5 cents a pound import duty on crude rubber. That would be an added tax of \$13,400,000, making a total of \$42,400,000.

All of the above are at least supposable. On the other hand, suppose American capital had some five to ten mil-

lion healthy Para rubber trees coming into bearing in our own territory in and about Mindanao. (There is room for hundreds of millions.) Such rubber would not bear an English, Dutch or American tax, either export or import. It would come to our factories at a market rate of 25 cents a pound less than British and Dutch, or indeed Brazilian rubber.

Or why stop at 10,000,000 trees? \$42,000,000 invested in *Hevea* trees would mean 42,000,000 trees just coming into bearing with an increase that would in a very few years make the Southern Islands of the Philippines one of the great rubber plantation sections of the world.

TU CHUNG RUBBER IN AMERICA.

IT has been definitely established that the rubber-producing *Eucommia ulmoides*, the tu chung tree of China, can be readily acclimated in other temperate countries and that it is perfectly hardy in Massachusetts. Whether the product of its bark, leaves and fruit is to be regarded as rubber or gutta percha still remains a moot question. In either case, however, it is valuable, gutta bringing $2\frac{1}{2}$ to $3\frac{1}{2}$ times as much as *Hevea* first crêpe or ribbed smoked sheet in the present market. As a feasible future supply, even though only partial, but grown within the borders of the United States, it may yet rank in importance with guayule, and deserves the attention of practical investigators as to its character, extraction and possible commercial uses. The tree being hardy in Massachusetts, it is reasonable to expect that it will also thrive elsewhere in America where suitable soils occur and the mean annual temperature corresponds to that of its Chinese habitat. Suitable regions are therefore clearly indicated by an isometric map showing the line of 59 degrees Fahrenheit across the United States. Moderately high valleys of the Allegheny, Blue Ridge, Rocky, Cascade and Sierra Nevada foothills suggest themselves as localities where altitude, soil and rainfall are likely to be particularly favorable.

SIXTY MILLION TIRES ANNUALLY AFTER 1920.

IT is not surprising that automobile tire manufacturing has become the principal department of the American rubber industry. Fully 4,000,000 cars are in operation in the United States to-day, a number more than four times the total for the rest of the world, and still the demand for machines keeps well ahead of the 40 per cent average yearly increase of past years. Time alone can tell what effect, if any, the war may have upon this demand, but once prices regain their normal level the result is certain. The proportion of pleasure cars is large, but motor trucks in ever greater numbers are replacing the shortage of horses caused by the war, both in peaceful occupations and warfare itself. Leading automobile men assert that the point of saturation will not be reached until every family having an income over \$1,000 owns a car. This means not less than 10,000,000

cars, or two and one-half times the present total. Assuming an average life of five years per machine, an annual replacement of 2,000,000 cars, our present production, will be necessary to maintain 10,000,000 in operation.

Translating this prediction into tires, 10,000,000 cars will average five tires annually, or 50,000,000 in all. The 2,000,000 cars constructed every year will require 8,000,000 tires for original equipment, and as each owner soon buys a spare for quick change on the road 2,000,000 more may be added, making a colossal grand total of 60,000,000 tires and a business amounting to \$1,250,000,000 annually.

THE IMPORTANCE OF COST ACCOUNTING.

THE value of the Federal Trade Commission's comprehensive campaign of education in cost accounting can hardly be overestimated. If the expert information, constructive suggestions and proffered cooperation be heeded, the results promise to be epoch-making in the upbuilding of American industry on a more stable basis than hitherto.

Business success at all times depends upon a complete and accurate knowledge of the cost of production and of selling. This is more emphatically true to-day than ever before because of keen competition in our home markets, due to ever-rising prices, and the certainty of even keener competition in the markets of the world after the war. We want a rightful share of the world's trade, particularly that of the western hemisphere; but it must be secured at a profit if it is to be worth the getting, and the manufacturer who does not know his true costs may price his goods foolishly and impair the business of his sound competitors while he ruins his own. The cost of selling, no less important than that of production, is too often almost entirely lost sight of. Every manufacturer must expect to face the low prices due to efficiency, but even the most efficient concern is not always able to meet cut-throat prices based on ignorance.

It is a fact that hundreds of industries are at the present time without adequate information regarding their own affairs, indicating that a large number of executives, however intimate their technical knowledge of manufacturing processes, do not have an intelligent grasp of general business methods. The Federal Trade Commission recognizes that the only basis for any industry is a solid foundation of fact, and that the installation of adequate cost accounting systems will not only insure fairer competition and better prices based on efficiency, but will remove many of the difficulties arising between competitors in business as well as between the government and business. To this end, the initiative has been taken to cooperate with trade associations endeavoring to work out uniform and adequate cost

accounting systems for their entire industry. It is not the intention to urge any particular method. Each industry must work out its own plan, but the Commission stands ready to act in an advisory capacity and to approve as the standard system for any particular industry that method of accounting which is found to be adequate and uniformly satisfactory to those concerned. In lending hearty support to this progressive movement the rubber trade will be doing itself and the nation a service.

TRAINING YOUNG MEN FOR EXPORT TRADE.

PERHAPS the greatest need in building up a successful foreign trade in rubber goods, or manufactured articles of any sort, is a staff of representatives who speak the language of the nation to which they are to go; who understand the details of the business they are to represent; and who have had a sound training in economics, finance and commerce, with minds trained to grasp situations quickly and schooled in what might be termed the diplomacy of business. Young and aggressive, though tactful men, are needed; men who will not require so much direction upon assuming their posts as to make them cost more than they are worth.

To meet this need quickly and well, progressive rubber manufacturers may well take a leaf from the book of the National City Bank of New York. In order to provide men for its many foreign branches, this great institution has worked out a plan of co-operation with universities and colleges whereby promising juniors and seniors are taken into the bank during their summer vacations and upon their graduation are placed in a preparatory training class. During these periods of training every effort is made to teach them not only the fundamentals of the business they are to represent, but those things which are so essential to foreign work, such as national characteristics and customs, methods of doing business and practical business conversation in the required foreign tongue.

England and Germany have long been pursuing similar methods in the promotion of foreign trade, and such a course on the part of American industrial as well as banking firms will do much to obtain and secure our logical share of the world's commerce after the war.

IF THE RESULTS OF GERMANY'S U-BOAT ACTIVITIES are measured by arrivals of crude rubber from England, the campaign is a failure.

For the first six months of 1916, approximately 11,000 tons of crude rubber was imported to the United States from London, Liverpool and Hull. For the first six months of 1917, there were 24,000 tons, or more than double that amount, from the same ports, and that despite the German submarines.

What I Saw in the Philippines—II.

By the Editor of The India Rubber World.

Kobe and Away—The Inland Sea and the Yellow Sea—Some Chinese Characteristics—Mr. Chang—Earlier Meetings with This Remarkable Oriental—His Corona Corona Experiment—I Meet Him Again in Shanghai—His Description of Tu Chung Rubber—He Elucidates His Plan for Tu Chung Plantations in the United States—An Astounding Scheme for Bringing About a Second "Rubber Boom."

IT is a long journey from New York to Manila, but one broken by several interesting way stations. In midwinter the stop in the Hawaiian summer land is very grateful, but after that it is distinctly cold. Indeed, sailing from Vancouver, and of course taking the extreme Northern circle to save miles, it is frigid at first, then cold, and finally off Formosa chilly and then warm.

Our stop in Kobe was brief, cold and uninteresting. Incidentally, as small pox was raging in Osaka, all on board were vaccinated. The voyage through the Inland Sea was dreary, snow squalls and chilly winds being the rule. And when we ran out into the Yellow Sea, it was not much better, as everything was blotted out by a bitterly cold, dense fog. We had a lot of Chinamen aboard, steerage passengers, and as first class passengers many Americans, Standard Oil men, and others resident in Shanghai. As we neared their home port they talked China very informingly and quite enthusiastically.

I wonder why we look with such tolerant contempt upon the Chinaman? A few hundred years with Bryan as our Confucius and our population grown to 600,000,000 would see the Americans just the same type of non-resistant, much-enduring creatures, and possibly wearing pig tails by decree of some autocratic boss. I doubt, however, if we ever were as universally honest as they.

I have always liked the Chinese, they are so bland, cheerful and fatalistic. They also are past masters in the art of minding their own affairs. A steamer friend went with me down to the steerage to see the Fan-tan, Chuck-a-luck, and other games. He was an adept at pigeon English and he spoke thus to one husky Chinaman.

"Spouse Jap man come chop chop makee fight?"

"No blong my pigeon, blong soldier pigeon. Him makee fight," was his contented reply.

I was eager to see Shanghai again, partly because the city interested me and more because I wanted again to meet Mr. Chang. I first met him on a P. & O. boat in 1904 voyaging from Ceylon to Singapore. He was a big, fine-looking man clad

in the richest of Chinese costumes, suave, observing and possessed of a serene dignity that was most impressive. Withal he possessed the keenest sense of humor mingled with a tolerance that bespoke the thinker and philosopher. The brusque Englishman, the egotistical German, and the thin-skinned, somewhat boastful American, all interested and often patently amused him.

I found him a veritable encyclopedia of information concerning affairs in the Far East. He knew rubber thoroughly; gutta percha seemed an inheritance; he confessed that his family for years had been financially interested in trading for it in the Philippines, in Borneo and Java. He knew all of the gutta grades in Singapore and was the first to give me an accurate

description of the *Dyera costulata* that produces Pontianak.

I shall never forget the clever way in which he turned the tables on a young chap who geyed and patronized him by turns. After winking to the rest of us, the American told of the discovery of a geological freak in Yellowstone Park—two deposits of mineral rubber and sulphur; of their mixture by volcanic action, and of the product being forced up through a geyser in the form of tubing hundreds of miles in length. And this was but one of many which he thought Chang swallowed.

One day, however, Chang handed him a cigar, saying:

"From the shape and the box you will think them Corona Coronas. They are, however, more costly. The Corona costs one dollar, Mexican, each. These cost me twenty dollars each. Smoke up and give me your opinion as to their value."

The guyer settled down to full enjoyment of his priceless cigar, apparently reveling in delicious aroma, praising the exquisite texture of the wrapper, expounding upon the sensuous sedative effect of—

"Some years ago," Chang broke in, "I brought home some seeds of the common American weed known as Mullein and propagated them. The leaves were rather coarse at first, but by cultivation I have arrived at a very much finer texture.

THE CHINESE BANK, SHANGHAI.

UNLOADING AT SHANGHAI.

Your Corona is made of Mullein, not tobacco. I only make a box a year and that is why, including the years of experiment, they cost me so much. How do you like them?"

"Pretty good imitation, as far as the appearance goes," said the Guyer judicially, dropping the unconsumed half into a cuspidor, "but, of course, you cannot really imitate tobacco to the connoisseur. You cannot get the fine flavor, the delicious aroma, the pearly ash, the sensuous sedative effect—"

"Man without imagination is a machine, a clod," said Chang. "You have vision, imagination, great. I never even saw a Mullein leaf. You were smoking a Corona Corona of real tobacco. Have another and don't be angry. Remember the stories you have been telling to a credulous Chinaman. Remember also that lying was a fine art in China before America was discovered. Shall we cry quits and say *pax verbasum*?"

I met Chang again on the "China" going from Hong Kong to Shanghai in 1905. Then I got better acquainted, and dining with him in the last named city, finally sized him up as one who would be a big man in any country, and, further, one who because of his unusual perspective would be a very sage and sane analyst of world conditions in the rubber or in any trade.

He was an omnivorous reader, and as he was a graduate of a leading English university his outlook was exceedingly broad. India rubber was his hobby. He knew it wild and planted. Not only that, but he knew the big factories the world over, had a good idea of machinery and processes, and had formed opinions of the leaders of the trade that were surprisingly accurate.

As I neared Shanghai, I, therefore, read again a letter received from him in New York the day before I had started for the Philippines. It read:

My Dear Mr. Pearson:

To us slow thinking Orientals the tremendous growth of your American rubber business is startling. It is fully as remarkable as the rise of the British rubber planting interest which you will recall I forecasted pretty accurately in 1904.*

There are still surprises and wonderful developments in store for your trade. I could greatly desire to discuss them with you. Many American rubber men stop here *en route* for the Eastern rubber fields. Why not you? A visit from

you would be most enjoyable, and I think interesting to you. Your old friend,

Chang.

In time we hove to off the mouth of the Yangtse Kiang, waited for a pilot, and went up the great river, and the next day were ashore with two days of shore leave ahead of us.

I at once looked up Mr. Chang in his modest but luxurious apartments.

Skiping over the preliminaries of greeting and trade gossip, and getting at once to the matter that was on his mind, said he rather abruptly:

"Why do not the Americans grow rubber at home?"

"They are experimenting with guayule in Texas," I replied. "Nothing else seems to be in sight at present."

"I wonder why our Tu Chung rubber would not be of interest to your people. You know it?"

"Only in a very misty way," said I. "You mean the product of the Chinese tree *Eucommia ulmoides*?"

"That is it. That is just it, and it has a future, I am sure. The tree is about the only rubber producer in the world that thrives in the temperate zone. It stands winters such as you have in New York state without any trouble at all. The bark is full of rubber. I have many times taken a piece of the dried bark of the tree, broken it and found it full of threads of rubber. It looked like the product of the grass rubber vine of Africa."

"What quality of rubber?"

"Ah, that I don't know. The idea only came to me lately to try and introduce it into America, perhaps as a reforestation scheme. The tree really has very profitable possibilities. Here in China we use the dried and powdered bark as a medicine and it sells for \$1.50 gold a pound. It is a specific for certain kinds of rheumatism, and

is not poisonous. Now this same bark contains rubber, about 3 per cent, I believe. Just picture the possibilities, say, \$1 a pound for a valuable drug, and more than enough rubber in it to pay for the cost of cultivation and gathering. Do you not think the experiment worth the trying?"

* The prediction of this amazing Chinaman was that the rubber production of the Malay States in ten years (1914) would be greater than that of the Amazon Valley.

TU CHUNG RUBBER TREE, 8 YEARS OLD.
ARNOLD ARBORETUM, BOSTON, MASSACHUSETTS.

BARK OF A TU CHUNG RUBBER TREE SHOWING THREADS OF RUBBER.

Photograph from the Bureau of Plant Industry, Washington, D. C.

"Where can I see some of these trees?" said I eagerly.

"When you return home, go to the Arnold Arboretum in one of Boston's suburbs, and you will see several. They have been growing there for some years."

That was the gist of his chat and the primary reason for his wish to see me. Of course we discussed *Hevea* planting in the Philip-pines, which he favored. Just back from Singapore, he also entertained me with planting gossip and information.

As I was leaving he said:

"Suppose plantation rubber in time reached a level of 30 cents gold a pound. As it drops there would be all sorts of efforts on the part of planters' associations to create artificial uses for the surplus and to curtail production to bring prices up. Personally, I believe that new and great uses for rubber will render such action unnecessary, but if one were a speculator there is a better, surer way."

"And that is?"

"Secure the bulk of the world's vulcanized rubber scrap. Distill it into caoutchoucine and other valuable by-products. If the scrap was cheap enough, and one had bought crude gum, around, say, 30 cents, when it went to a dollar the profit would be quite considerable."

The next morning, just before we sailed, Mr. Chang came aboard to say good-bye. As usual, he had something unusual to say.

"It was not Tu Chung rubber or a boom in crude rubber that I wanted to talk to you about—to get you thinking over," he said. "It was this, and I hope you will watch developments carefully. The United States and China as well will get into the world war. The Prussian, through teaching his people that they and their desires are all important, has come to possess a super-egotism that is akin to madness. His sense of proportion is entirely atrophied. The outrages in America will bear their fruit. As for China, she has been oppressed by many nations, and by the individuals of many

peoples, but by none so brutally or so universally as by the Germans. So, as I said, both of our countries will enter the war on the side of the Allies. In time, say a year or two, there will come a shortage of labor. So great will this be that the huge reservoirs of willing, tractable laborers, particularly in China, will be needed. Labor unions will see that

their members are not menaced. First in the tropics, and later in the temperate zones, the Chinese laborer will be used by the tens of thousands. In your own line, on rubber plantations, and in American rubber factories, you will see Chinese help. America is rich enough to afford it, and, mark my words, before the American consents to put his women folk

in trousers and force them into factories, she will scour the world for masculine workers. And it should be so. It is the beginning of the world federation that will utilize, guard and profit by the producing capacities of every race under the sun."

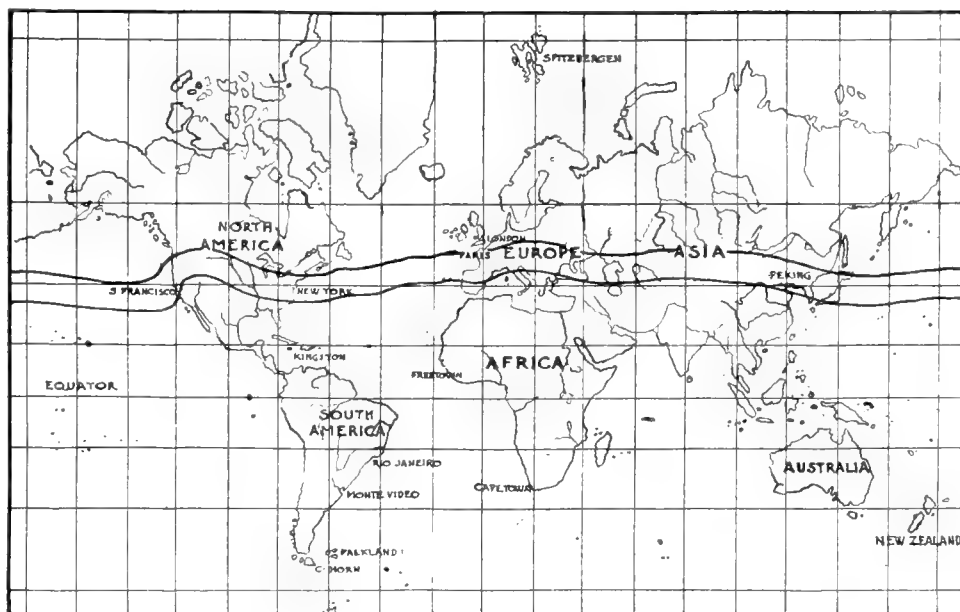

"Perhaps you are right. At any rate, the tropical need for your labor is great and growing greater," said I. "There is, however, a point you seem to miss. You have lots of labor. Why not use it right where it is, right at home?"

"How?"

"Well, you believe rubber growing to be a good proposition. Start your millions of coolies growing milkweed, rabbitweed or some other minor rubber product—something that will give an annual crop. Put a million or so at it and the rubber product will be considerable."

"Maybe some time. No can do now," said Chang with a smile.

With that he departed, and we proceeded down the Yellow River, turned

ISOTHERMAL LINES BETWEEN WHICH TU CHUNG RUBBER WILL GROW.

IN THE INLAND SEA.

south and pointed the boat's nose for Luzon.

It's a long way to Luzon—that is, from New York; it takes a solid month to get there by railroad and steamer, two months by magazine. Here I expected to find much that would be of interest and my hopes were not disappointed.

(To be Continued)

India Rubber in War.

By Robert G. Skerrett.

MUCH is heard of the part steel is playing in modern warfare, but has the world, or indeed the rubber trade itself, half grasped the extent of india rubber's vital contribution to this monster world-wide conflict? Hundreds upon hundreds of our factories are working to capacity in order to produce rubber products of one sort or another, and now that we have joined hands with the Entente Allies these establishments must expand and run well-nigh continuously to turn out a still greater volume of these myriad commodities. Our rubber industries may well look up and feel a sense of pride in the part they have played and the greater part they are bound to play in this Titanic struggle.

The past three years of war in Europe have brought to a focus the inestimable value of rubber and, what is more, have clearly emphasized the fact that chemistry's cunning has not yet evolved a really all-round substitute. Germany's initial use of motor-truck service gave a new complexion to the problem of shifting quickly great bodies of fighting men, and probably Paris would have fallen to the Teuton troops if General Maunoury had not rushed to the battle-front a whole army by means of Parisian taxicabs. All of the belligerents then suddenly awakened to the need of self-propelled vehicles, and it was not long before they grasped, as well, the fundamental requirement of an abundance of rubber tires.

THE IMPORTANCE OF TIRES.

In the earlier stages of the war wastage in tires was little short of appalling. This was due to lack of organization, the casting away of damaged tires upon the roadside, and the frequent employment of misfit tires in a service that covered rough roads with the heaviest of burdens. Among the Allies a goodly measure of order has been instituted in this extremely important department of supply and transportation, and there are now operating centers to which all injured tires must be sent. New ones are no longer issued to a driver without question as to his disposition of the worn ones. Even so, the wear and tear are tremendous, and it is said by those in a position to know, that solid rubber tires in military service seldom average more than 1,500 to 2,000 miles. This is less than one-tenth of the mileage commonly expected in commercial use. Over-loading, over-speeding, hard service in all sorts of weather upon all kinds of roads exact their toll when necessarily combined with indifferent attention, while the exigencies of the moment preclude careful driving, and hasten destruction.

TIRES FOR 150,000 MOTOR VEHICLES.

It is safe to say that the Allies, in their various fields of military activity, have in service for transport and staff work rubber-tired automobiles and motor trucks to the number of

300,000 or more. These machines are using up, at a conservative estimate, certainly five times as many pneumatic and solid tires as would ordinarily be expected under normal conditions. And let it be remembered that this durability is secured in a large degree by reason of rubber fillers of one sort or another that make it possible to drive the pneumatic tire until it is almost completely worn out. No wonder, then, that Germany has made desperate efforts to obtain rubber, for, despite her network of railroads, the ultimate mobility of her forces and the maintenance of their supplies of all sorts depends basically upon motor vehicles.

According to the estimates of the Council of National Defense and our military authorities, an army of a million men will require anywhere from 30,000 to 40,000 motor trucks, and bids for these have already been asked. Inasmuch as it is said that we are to raise an available and thoroughly equipped force of 2,000,000 to 2,500,000 men, we shall need at least 100,000 motor trucks for transport and supply service alone. This does not take into account the ambulances for hospital service and the thousands of automobiles that would be required for various staff duties. It is probably safe to say that we shall have to have a maintained organization of substantially 150,000 motor

vehicles of one kind or another in order to keep the service up to wartime demands. With our knowledge of tire consumption abroad, and with the figures already cited, our manufacturers are clearly face to face with a giant task in this one department of the rubber industry.

MOTORCYCLE TIRES.

Very recently our government asked for bids for 10,000 motor-cycles. This number will unquestionably be greatly increased, because it is a matter of record that the British army alone has in the neighborhood of 100,000 of these machines in service to-day. So far as carrying dispatch bearers and mounted scouts is concerned, the wear and tear upon tires would be hard, but not as disastrous as the stresses of motor-truck service. However, it is evident that a large number of our

ultimate array of military motorcycles will be equipped with side-cars and also provided with machine-guns. For work of this sort the motor-cycle must be both powerful and rugged, and the ultimate burden will rest upon the rubber tires. Here the tax will be excessive and it is quite likely that tire deterioration will equal that of the motor truck, because the machine-gun squads must reach their destinations whenever it is humanly, physically and mechanically possible to do so.

In connection with automobiles, motor trucks, tractors, ambulances and motor-cycles, it must be remembered that rubber is also used in a variety of subordinate ways. For instance, there is rubber in the construction of the batteries of self-

A SOLDIER'S FIELD KIT.

starters, the electric wiring calls for rubber insulation, and rubber is employed in the handles of starting cranks, controller levers, radiator caps, gasoline tank caps and steering wheels. Some of the ambulances used by the British have permanent features in the shape of rubber buffers and stops, and rubber flooring has made it easier to keep these cars clean and likewise to provide a surer footing when handling the wounded.

THE AIR SERVICE AND RUBBER.

Nor should the vehicle wheels of the warplane be forgotten, because it is upon these that the initial start and the safety of landing fundamentally depend. Resiliency is absolutely necessary, and rubber only will furnish the springy tire needful to facilitate rising from the ground and to help absorb in a very large measure the shock incident to landing. It is not possible here to go into the niceties of this matter other than to say that nothing but the best of rubber will serve this purpose; and the perfected flying machine tire has called for a good deal of experimenting in order to meet the peculiar demands of the service.

It has been authoritatively declared that five airplanes are needed yearly to maintain a single flyer aloft, and this quota is additional to the replacement of aircraft demolished by gunfire. No wonder, then, that the French army organization, as it exists to-day, calls for 30,000 flying machines annually. This takes no account of the British, the Belgian, the Russian and the Italian service, and does not consider at all the aircraft needs of the enemy. We have virtually promised to send abroad 20,000 aviators, and to maintain a force of this size we shall have to build every 12 months quite 100,000 machines. The rubber industry will have its hands full, not only in furnishing the tires, but other rubber parts which virtually duplicate many of those of the automobile. Further, there are special features, peculiar to the warplane, incident to the mounting of machine guns, the growing equipment of wireless installations, and the need of additional shock absorbers, in the form of cushions where the radial supports converge, when bombs are carried. Finally, the best of the fighting flying machines have their wings covered with a rubberized fabric in order to prevent the absorption of moisture and the burdening of the aircraft with useless dead weight; and rubber tubing is used more or less extensively to prevent chafing where control wires and stays touch neighboring surfaces.

The seaplane, because of its frequent contact with the water, needs rubber extensively; in fact, it calls for quite as much of this material as the airplane, despite the fact that it generally dispenses with wheels for starting and landing. It is absolutely necessary that all electrical features be doubly protected against moisture, and all controls, both hand and foot, seats, gages, etc., must be either waterproof or watertight, as the case may be. The airmen must have rubber suits covering them from head to foot, and should carry air-inflated rubber life belts, together with respirators of the same material, which will make it possible for them to endure a submergence of 30 minutes in case of accident when entangled in their wrecked machines at sea. Rubber covers are now called for to protect light machine-guns

whether on shore or afloat, and as many of the big seaplanes have one or more of these weapons it is plain that rubberized cloth figures very largely in this service.

As long as we are more or less up in the air, let us consider that other branch of aviation which concerns captive balloons and dirigibles. Of the latter, the most successful development among our Allies is in the form of what the British call "blimps." The blimp is a gas-bag modeled to some extent along the lines of a giant fish or whale. The first of these produced for the navy, officially known as D N-1, is 175 feet long, and has a maximum diameter of 35 feet. The outer envelope contains 2,500 yards

of double-texture rubberized fabric, and the internal balloonets, of which there are two, call for some hundreds of yards more. It is said that the government will have 300 of these blimps for home service. Already the second of the sixteen contracted for has been given a trial flight, and the naval authorities are said to be enthusiastic. Large orders will undoubtedly be placed at an early date. This dirigible is provided with pontoons beneath the chassis which makes it possible for the blimp to settle upon the water. These pontoons are long cylinders of rubberized

A UNITED STATES ARMY MOTOR TRUCK WITH RUBBER TIRES, PROOFED COVER AND DRIVER'S SHELTER.

fabric stuffed with kapok, a silky fiber of great buoyancy.

Next there is the kite balloon for naval service, which is a passive elongated gas bag that can be towed from a steaming craft for the purpose of aerial scouting as well as detecting the approach of submarines or discovering U-boats in hiding below the waves. The land counterpart of the kite balloon is generally the so-called more or less globular or pear-shaped gas bag familiar to most of us. We shall probably have to have scores of kite balloons and the ordinary captive observational balloons. Plainly, our manufacturers of proofed material will have to provide us with hundreds of thousands, yes, millions, of yards of rubberized fabric. Thousands of these aircraft are now in service abroad. Rubberized gloves, rubber-banded helmets to protect the aviators in case of falls, goggles, and rubberized suits are extensively worn by the flyers in all departments of aviation.

RUBBER REQUIREMENTS OF THE ARMY.

And now let us consider the rubber needs of the army fighting man, *per se*. During the past fiscal year, that of 1916-1917, the War Department called for bids on 47,312 ponchos and 24,380 slickers. These, it will be remembered, were to cover the requirements only of the army's regular peace time establishment. The specifications for the cloth demanded a rubber content of not less than 30 per cent of the best Up-river fine Para rubber or best Ceylon rubber and not more than 6½ per cent of the best reclaimed rubber. Counting the proposed initial force of 650,000 in the National Army, 300,000 in the standing army, and State Militia or National Guard to the number of 300,000—as it would be if recruited to the maximum—this gives us some idea of the number of ponchos and slickers needed in the first six months of conflict. Every man and officer has either a slicker or a poncho. This, in substance, constitutes the regulation rubberized clothing prescribed heretofore by the United States military authorities.

Today, because of the lessons learned on the battle-fronts abroad, particularly those taught by trench warfare, rubber equipment of a variety of sorts is now recognized as indispensable. Owing to the well nigh continual presence of water in the trenches, rubber hip boots have become a regular part of the soldier's equipment, and in many cases the rubber stocking, worn between two woolen or cotton socks, meets the average need at any time but stormy weather. The rubberized ground sheet, with which each fighting man abroad is supplied is the European substitute for our poncho. It not infrequently has served as a shroud when the soldier has fallen on the battlefield. The wastage in trench boots, rubber stockings and ground sheets is enormous; in fact, it has been estimated that the total wastage of all rubber goods at the front, 18 months ago, was in the neighborhood of 4,000 tons daily. This destruction has unquestionably greatly increased in the interval, and will be a good deal higher after we join forces with our Allies.

The officer boasts some additional rubberized articles, such as a waterproof valise, a sleeping-bag and a collapsible rubber bathtub or basin. Staff officers also are provided with rubber fabric motor-ing-rugs, and all of the men of the motor-ing-service have rubber garments, while motorcyclists have proofed overboots and leggings combined. Rubberized cap-covers are well-nigh universal, and a combination hood and cape of waterproof material is growing steadily in favor. The gas mask, in which proofed fabric and rubber sponges play a prime part, is a universal article of equipment.

Every man and officer must have one, and a substantial reserve should be available to take care of wastage. With every mask there should be a waterproof wallet in which to keep the respirator which neutralizes the action of the poisonous atmosphere.

The foregoing equipment of rubberized articles or garments is necessary, in fact is the regulation outfit abroad; and we shall have to provide our troops accordingly. In addition it is optional, especially among the officers, to supply themselves with waterproof toilet cases, pocket filters with rubber tubing, and goggles that call for more or less rubber in their make-up. Rubber gloves are extensively in demand in certain branches of the military service, particularly where live electrical circuits have to be dealt with and also in the handling of certain explosives. This is notably the case in the charging of mines, floating and otherwise, and wherever guncotton is used for the bursting charge.

Regarding the need of rubber in its protective capacity against the attack of acids, the manufacture of smokeless powder, guncotton, nitroglycerine, dynamite, etc., calls for rubber gloves

and rubber aprons, not to mention boots. Every pound of these explosives utilizes sulphuric and nitric acid at one stage in their preparation, and it would be impossible for the workers to perform their tasks without the aid of rubber garments. Many hundreds of thousands of tons of explosives have been produced since the war began; enormous quantities of nitric acid, sulphuric acid, and other chemicals have been manufactured in the last two years and a half; and in the whole of this grim industry, rubber in one shape or another has been indispensable. This business of providing munitions has grown to tremendous proportions in this country, and the factories will work to still greater productiveness in order to furnish our army and our fleet with its needful explosives.

An integral part of modern warfare is the extensive use of the telephone; indeed, fire control is well-nigh universally regulated in this way. Everyone knows how important rubber in one form or another is to an efficient telephone service, and on the battle-front that service absolutely must be efficient in every particular. Therefore, insulation is insisted upon to an extent that is not deemed needful ordinarily, and mainly because the physical conditions are infinitely more trying. Nothing answers like rubber for this purpose, where wet ground and continual moisture have to be contended with. Again, there are the circuits of mining and countermining operations, improvised lighting and power systems — particularly where searchlights are employed — and wire entanglements are charged with high-voltage currents. Thousands upon

THE RUBBER-TIRED WHEELS OF AN ARMY AIRPLANE, SHOWING THE RUBBER CUSHIONS IN THE AXLE SHOCK ABSORBERS WHERE THE RADIAL SUPPORTS CONVERGE.

thousands of miles of insulated wire have been and will be required. Our own fighting force in Europe will have to be supplied generously in kind.

As part of the transport service and the "supply train" equipment, we must not forget waterproof motor hoods, cart covers and collapsible rubber horse troughs, water buckets and tanks. And that the powder shall not fail in the hour of need there is also provided a vast array of rubberized powder bags. The treads of the "tanks" and the heavy guns and mortars also need rubber blocks to make them equal to the varied conditions of the roads or ground over which they have to make their way. And, finally, in considering the army's needs, those aids to effective fighting, field glasses, range-finders and telescopic sights must be included. In all of these optical auxiliaries either hard or soft rubber, or both, are required, and while quantitatively the amount of this material is trifling compared to rubber's other uses, still its service is important.

RUBBER REQUIREMENTS OF THE NAVY.

Our navy has long been a big consumer of rubber, and even

in times of peace the fleet's demands have grown steadily year by year. It is not possible to give more than an approximate idea of the amounts, simply because the shipbuilders provide

MUCH RUBBER IS USED IN THE MAKE-UP OF THE NAVAL DIVER'S EQUIPMENT.

Rubber hose, all kinds	3 000 feet
Hard rubber knobs (electric service)	1,100
Gaskets, various	32,000
Boots	8,500 pairs
Squeegee blades	25,000
Washers	3,000
Elastic webbing	5,000 yards
Buttons	110,000 dozen
Rescue breathing apparatus	100 sets
Diving apparatus, complete	14 sets
Diving suits	150
Rubber packings	1,500
Sheet rubber for packing	442,000 feet
Rubber insulated wire, ignition circuits	1,000 feet
Rubber insulated cable	600 feet
Rubber gloves, acid proof	1,520 pairs
Hard sheet rubber	3,500 pounds
Rubber pump valves	2,250 pounds
Rubber ferrules	27,600
Rubber insulating tape	9,450 pounds
Acid-proof rubber belting	500 feet

Manifestly, these are by no means all of the ways in which rubber is used in the navy. Rubber tiling or rubber flooring and rubber mats, step treads, door stops, and the like, are to be found in every direction on fighting craft of all sorts. The dreadnought boasts an electric power plant that would meet the needs of a good big town. This form of energy must be perfectly controlled and only the best of rubber insulators will answer. Therefore this material has an extremely wide service to perform in this department alone; and, because of the character of the original installation, replacement is seldom required except upon a modest scale.

As can readily be understood, the submarine, with its dual motive system and recourse to electrical propulsion when traveling under water, uses rubber more extensively than any other fighting craft—judged upon the basis of its total displacement or

the bulk of this when the vessels are constructed and Navy Department advertisements for any twelve months cover only wear and tear or replacements. But the volume of these replacements is suggestive, and shows some of the directions in which rubber enters into the effective work of our battle craft and the outfitting of our blue-jackets. Therefore the following list is given:

dead weight. The batteries have hard rubber containers or jars; the positive and negative plates are isolated by hard rubber separators, and the accumulators have other hard rubber fittings. Sponge rubber condensers serve to arrest the particles of electrolyte in the rising gases, and frequently soft rubber ventilating tubes are provided to draw off and to exhaust forcibly any accumulation of hydrogen. Because of the moist atmosphere, induced by the sweating hull plating, all electrical wiring and connections have to be insulated with the utmost care. This is especially necessary in view of the high potential of the current fed from the batteries to the propulsive motors and to the various electrical auxiliaries that now do much of the operative work in a submarine. The under-water boat has a number of hatches and openings to the sea of large diameter which must be sealed hermetically when the craft submerges, and in order to insure this watertightness, seatings or gaskets of extra heavy soft rubber are employed. The doors of the various watertight compartments also are made secure by rubber packing, while rubber matting, rubber treads, etc., are found in many directions.

The wireless outfit, of course, has its necessary measure of insulation provided by hard and soft rubber; the periscopes are made watertight and yet free to move by means of rubber packing; the electricians have to have rubber gloves and use rubber tubing in testing and overhauling the storage batteries; the internal lighting system, of course, is safeguarded by rubber-

covered circuits; and, finally, the submarine's prime weapon, the torpedo, cannot get along without rubber—especially the rubber diaphragm which plays a vital part in the torpedo's depth control. Rubber, too, enters into the construction of the submarine mine which, as we all know, can be carried and planted by under-water craft. Of course, the officers and crews of submarines, because of the exceptionally wet work of the service, have hip-

THE RUBBER SUIT OF A SEAPLANE PILOT.

boots of rubber and, generally, hats and overdress of the same material. Escape helmets for the personnel of submarines contain a good deal of rubber in their make-up, and all of our under-water boats are supplied with these.

At the present time it is not in keeping with the policy of the government to go further into detail as to quantities of any of our fighting material. It was for that reason that a list was given of an average rubber consumption for a peacetime year in the fighting fleet. Under normal circumstances, the enlisted personnel of the navy is less than 60,000. Now, with many of our ships in reserve fully commissioned for wartime service, with scores of auxiliary craft added to the fighting fleet, and with the Coast Guard a part of the regular navy, it is safe to

say that our water-borne defense force numbers in the neighborhood of 150,000. These figures will serve to give an approximate notion of the increased demands for rubber equipment for the men, as well as rubber needed aboard the augmented fleet. Indeed, the drive of wartime duty is sure to add greatly to the figures of peacetime consumption.

It will be borne in mind, besides, that the Marine Corps has been raised from 17,000 to substantially 30,000 men. The Marines need an equipment similar to that of the army man, but as our sea soldiers are expected to fight ashore and afloat they must be thoroughly prepared to meet the physical conditions of either service. No mention has been made of the Naval Militia, *per se*, because this excellent body of State fighting men is now amalgamated, almost in its entirety, with the personnel of the battle-fleet.

So far, nothing has been said about the medical departments of the army or the navy, as such, simply because the whole subject of taking care of the wounded can just as well be treated for both services under a single head. It is quite out of the question to give details as to quantities, but a recital of some of the uses to which rubber is put by the military surgeon and the military hospital will suffice to suggest the volume of these commodities that must be supplied continually from now on. In any estimates, it is only safe to assume that sooner or later our navy, in its entirety, will have to share in the ravages of battle. And whether it does or not, medical provision for such an emergency will have to be made.

HOSPITAL RUBBER REQUIREMENTS.

To begin with, the army that is to be sent abroad at the earliest moment will need quite 28,000 doctors, and the medical corps of the navy should total no fewer than 2,000. All of these men must have rubber gloves and, preferably, rubber operating aprons. Only recently, one of the British War Commission declared that on a short section of the front as many as 20,000 to 30,000 are wounded in the course of a battle lasting but a few hours! Happily, quite 50 per cent of those hurt are able to return to duty within a comparatively short period, and experience has shown that 25 per cent, after furloughs for convalescence, can return to the front; and, finally, something like 17 per cent, after more or less prolonged stays in hospitals, are able to resume their duties. However, these results in any case are made possible only by the best of surgical treatment, and, because of the constant danger of infection, a great many of the wounds call for careful and systematic sterilization. It is in this work that rubber plays a prime part in the form of tubing, which is an essential feature of the present apparatus employed to drain or irrigate the wounds.

Another revolutionary innovation is a system of elastic bandages which, without stitching, pull the wound surfaces gradually together and produce a minimum of deformation. All of the ambulances, operating rooms, and surgical wards require rubber sheeting. There are hot water bags, ice bandages or caps, pads, inflatable pillows and mattresses calling for rubber or proofed material; bulb and bag syringes, medicine droppers of first-aid packets, basins, sprays, operating caps, crutch tips, ether bags, bottle stoppers, sponges, catheters, rubber flooring, rubber heels for hospital attendants, rubber-tired wheelbarrows for carrying stretchers, and hundreds of other ways in which rubber helps to save life, eases the wounded, and effects administrative economies in the military hospitals either in the field or at the bases. Rubber gloves and aprons are quite as necessary for the nurses and ambulance attendants as they are for the surgeons. Of nurses and other attendants there must be a small army for a fighting force of a million and more men at the front. Further, the care of the wounded will not be the only concern. Despite serums and the like, disease may lay a heavy toll upon our fighting men on the fields of Europe. And in the treatment of fever stricken soldiers, rubber articles of one sort

or another will be indispensable in steadily increasing quantities.

At the time of writing this article, the American flag is flying over six great base hospitals in France—institutions wholly administered by American surgeons and physicians. Just what this means can be gathered from the equipment of a single unit. Each of these comprises 1,600 beds; and the total of the six hospitals is 9,600 beds! What we shall have to provide for when our part in the conflict is in full swing is, of course, purely speculative. However, it is evident, from what has been needed in the treatment and care of the wounded of the Entente Allies, that we shall have to provide enormous quantities of rubber surgical goods available on the other side of the Atlantic and likewise very large supplies ready for our fighting fleet.

PROTECTED OCCUPATIONS IN ENGLAND.

IN England, where conscription has greatly depleted working forces, it has been found desirable to prepare a schedule of protected occupations affecting men employed on Admiralty, War Office, or munition work, or in railway workshops, Admiralty work being taken to include merchant shipping. It is not intended to enlist such men as had attained the age of 32 on January 1, 1917, and for the present such men who are not passed fit for general service, "Category A," will not be recruited. Otherwise the schedule is provisional and subject to revision should army needs require a further release of men; or should it develop that some of the occupations might later be undertaken by women or older men. Those engaged in the occupations cited and within the age limits will be posted for military duty only after consultation with the local representative of the Government Department concerned.

Rubber Manufacture is given a special section, and the following classes of workers are protected when the individuals had attained on January 1, 1917, the age specified in brackets in each case or were engaged in the occupation (not necessarily with the same employer) on or before August 5, 1917:

HOSPITAL GOODS. Departmental foreman (23), cutter (25), molder (23), process workers (including calender hands) (23), stover (23), spreader (25), surgical tubing (maker of, including catheters) (23), vulcanizer (wet) (21), vulcanizer (dry) (25). Protection applies equally to men engaged in contracts for public and private hospitals.

OTHER RUBBER GOODS. Foreman (27), calender man (27), mixer (27), molder (27), spreader (27), hose maker (25), vulcanizer (wet) (21), vulcanizer (dry) (25), ring and washer cutter (25).

In the allied trades the following occupations are protected:

CANVAS HOSE PIPE MANUFACTURE. Tackler (28), tenter (28), weaver (28).

WOVEN BELTING MANUFACTURE. Stretcher (27), painter (27), finisher (27).

ASBESTOS MANUFACTURE. Skilled workmen only (23).

ELECTRICAL INSULATING MATERIAL MANUFACTURE. Skilled workmen only (applies to workmen of all ages).

ELECTRICAL WIRE AND CABLE MANUFACTURE. Skilled workmen only (applies to workmen of all ages).

MANUFACTURE OF ENGINE AND PUMP PACKINGS AND JOINTINGS. Skilled workmen (21).

This schedule confers no right of exemption from military service if skilled artificers needed by the army cannot be supplied from other sources or it is possible to find substitutes. Men having bad records of absence from work will obtain no protection by reason of their occupation.

"Rubber Machinery." Mr. Pearson's newest book, filled with valuable information for rubber manufacturers, is now ready for mailing. Price, \$6.

War News of the Rubber Industry.

THE participation of the rubber industry in the nation's war plans continues with the utmost enthusiasm. Preparedness in the great struggle for world freedom progresses without abatement along many lines, and in the opinion of leading rubber men will so continue until Allied arms are victorious.

The oversubscription of the two billion dollar Liberty Loan by \$1,035,226,850 showed the American will; the ease with which the Red Cross fund of \$100,000,000 was considerably exceeded showed the American heart. In both campaigns the rubber business was handsomely represented. And now the Rubber Trade Roll of Honor is beginning to show in a substantial manner individual American grit and determination. It does the heart good to study those names, to note the goodly proportion of native Americans among them, and also to realize what American ideals and institutions mean to our foreign-born population—that the United States is indeed the world's melting pot and that in this war, lovers of freedom, regardless of their origin, are to stand shoulder to shoulder fighting for the common cause.

Once more THE INDIA RUBBER WORLD urges its readers to cooperate in stimulating war enthusiasm by sending for publication particulars of all patriotic acts and movements, corporate and individual, in order that this permanent monthly record of what the American rubber industry is doing for the defense of liberty and justice may be complete.

THE LIBERTY LOAN.

Through the courtesy of Frederic C. Hood, treasurer, Hood Rubber Co., Watertown, Massachusetts, we are enabled to pub-

Clapp, E. W., Rubber Co., Hanover, Mass.....	61	3,950

lish the accompanying list of New England subscribers in the rubber trade. It will be recalled that at the request of Alfred L. Aiken, governor of the Federal Reserve Bank of Boston, Mr. Hood represented the rubber industry on a committee of New England manufacturers to promote the sale of the bonds among factory operatives, office and sales forces. To his enthusiastic initiative in working out a partial payment plan, circularizing every New England rubber concern and encouraging participation and cooperation, is due a goodly measure of credit for the handsome total of \$1,754,455 shown by the appended list. This is still incomplete, however, the returns from a number of factories of the United States Rubber Co. and several other firms not yet having been received. The final

total is expected to be well above \$2,-000,000.

Of the \$1,400,000 worth of bonds taken by employees of the United States Rubber Co., New York City, \$67,000 was subscribed by the Hartford, Connecticut, plant, \$125,000 at the Morgan & Wright plant, Detroit, Michigan, and \$560 at the Denver, Colorado, branch.

A vigorous campaign for subscriptions among employees of The Goodyear Tire & Rubber Co., Akron, Ohio, netted 12,700 persons who obligated themselves to purchase \$800,000

worth of bonds on the \$1 weekly instalment plan.

Twenty-seven nationalities were numbered among the 11,000 odd employees of The B. F. Goodrich Co., Akron, Ohio, who subscribed \$750,000.

Practically every employe of the Polack Tyre & Rubber Co., New York City, subscribed for at least one bond.

THE RED CROSS.

Rubber companies and their employees responded generously in the recent campaign to raise \$100,000,000 for the American Red Cross. Unfortunately the following list of donations is far from complete, many companies not having announced their totals.

On June 22 Akron, Ohio, had exceeded its quota of \$150,000 by \$11,372 and a new mark of \$200,000 was set. The team headed by P. W. Litchfield, vice-president of the Goodyear Tire & Rubber Co., had raised \$15,800, and that headed by R. M. Pillmore, president of the Mohawk Rubber Co., \$5,168. Barberton, Ohio, had raised \$42,000.

In a four days' campaign 98 per cent of the entire working force of the Goodyear Tire & Rubber Co., Akron, Ohio, was enlisted as members of the Red Cross. In all, 17,865 names were secured.

The Somerset Rubber Reclaiming Co., New Brunswick, New Jersey, has enrolled all its men in the American Red Cross, paying their dues for one year.

The McGraw Tire & Rubber Co., East Palestine, Ohio, from the president down to the janitors, contributed to this worthy cause, the total being \$1,600.

The National Tire & Rubber Co., East Palestine, Ohio, gave \$600.

The employees of the Boston Woven Hose & Rubber Co., Cambridge, Massachusetts, gave \$341.06, including the subscriptions of 212 new members.

AMBULANCE WORK.

Richard G. Conant, for four years tire fabrics salesman for Brighton Mills, Passaic, New Jersey, who sailed for France June 30 as a member of the American Volunteer Ambulance Corps, will drive a \$3,000 ambulance purchased with a fund raised by those interested in Brighton Mills and other friends of Mr. Conant.

COMFORTS FOR THE NAVY.

The young women in the various departments of the United States Rubber Co., at the New York City offices have formed a knitting unit, and now spend a portion of their lunch hour in the footwear sample room knitting jackets, socks, wristlets, mufflers, etc., for the Comforts Committee of the U. S. Navy League.

ENLISTMENTS EXCEED GOVERNMENT QUOTA.

Of the 1,600 men of conscription age registered for the selective draft at the plant of the Hood Rubber Co., Watertown, Massachusetts, 160, or 10 per cent, have already enlisted. This exceeds the quota of about 7 per cent required by the Government to give an army of 670,000 out of nearly 10,000,000 eligibles at the first draft. Despite its many foreign workers this factory seems to be a hotbed of patriotism. Of the total 7,400 employees about 5,000 are men.

WOMEN TO REPLACE ENLISTED MEN.

Women will replace many of the operatives in the plants of the General Electric Co. at Lynn, East Boston and Pittsfield, Massachusetts; Schenectady, New York; Harrison, New Jersey; Erie, Pennsylvania, and Fort Wayne, Indiana, many of whom have enlisted and still more who will respond to the first selective draft. The names of 12,000 young women are already enrolled on the alarm list awaiting a call when needed. It is understood that they will don overalls as the only sensible factory uniform for their new work.

At the Lynn, Massachusetts, factory, 63 apprentices in the naval and military service were tendered a farewell reception by their fellow employees recently. General Manager Walter C. Fish, Chief Consulting Engineer, Magnus W. Alexander, and Prof. Elihu Thompson delivered addresses.

All employees will henceforth work a half hour extra each week, their earnings being donated to the Mutual Relief Fund for assistance to men in active service and their dependents.

INCREASING THE FOOD SUPPLY.

The office staff of the tire factory of the Canadian Consolidated Rubber Co., Kitchener, Ontario, has a splendid garden near the factory which promises a bumper crop of beans and other vegetables. Factory Manager Kabel and Superintendent Gruenwald have been enthusiastic participants in the hard work of plowing, planting and cultivating.

COMMERCIAL ECONOMY.

Just as consumers of foodstuffs are being urged to eliminate all waste, to practice sensible economy and to discontinue the use of certain articles, so business firms are requested by the Commercial Economy Board of the Council of National Defense to limit the number of styles of manufactured articles and the practice of goods on consignment, that waste may be reduced to the minimum; to reduce or abolish retail deliveries that this unproductive labor may be put to better purposes; to adopt concrete construction for their factory additions that war demands for steel may be met; and above all to unload every freight car as soon as it is received in order to break the car shortage. This latter practice will do more than any other single factor to stop the coal panic and expedite a condition of fuel sufficiency.

Official statistics of the Department of the Interior indicate that despite the extra demand in this country and the urgent needs of our Allies, no one can doubt that the coal industry will be able to supply all needs. Last year the production of bituminous coal in the United States was the greatest in the history of the country, but that record was exceeded by fully 20,000,000 tons during the first six months of this year. The difficulty of distribution is the great problem, and notwithstanding the improved car supply, this difficulty is likely to become intensified during the coming winter months.

- 82 New York National Guard.
- 83 U. S. S. "Kearsarge."
- 84 American Field Service, Munitions Transport Drivers.

NO MORE DENTAL RUBBER FOR GERMANY.

Agents of the Department of Justice believe that the smuggling of dental rubber to Germany has finally been stopped. The story is an interesting one.

Strangely enough, while Germans and Frenchmen make wonderful physicians and surgeons, they are said to be abominable dentists. Certain it is that in Germany American dentists have the very cream of the business. The Kaiser himself patronizes one of a colony of about 15 in Berlin who charged extravagant prices, maintained pretentious establishments and had practically no competition.

When war was declared their supplies of dental rubber were cut off. The German Government commandeered almost all the rubber in the country and the British blockade ships seized rubber in every shape.

Then the dentists started smuggling it through from America. The dentist would send his wife to New York. She would get a quantity of dental rubber and make bargains for its transportation with stewards, probably on the lines between New York and Copenhagen.

These men carried large bundles aboard their ships at night. At Copenhagen the rubber was expressed to Berlin. Letters were sent over in the same way, both in violation of United States laws. Agents of the Department of Justice and of the Revenue Service shadowed some of the women and the traffic stopped.

RUBBER LEADS LONDON EXPORTS TO AMERICA.

The total value of declared exports from London to the United States for the five months ended May 31, 1917, amounted to \$78,779,911, compared with \$77,115,135 for the same period in 1916. Of these totals rubber amounted to \$20,696,269 and \$31,447,629 respectively. Although the total exports for the period have increased only about \$1,665,000, rubber shows a gain of nearly \$11,000,000, and in fact forms 40 per cent of all exports. No wonder U-boat commanders are disheartened!

A SHIP FOR RUBBER CARGOES.

THE recent complacency of large American manufacturers regarding crude rubber supplies finds explanation in the fact that the United States Shipping Board, in consultation with the Committee on Rubber of the Advisory Commission of the Council of National Defense, has arranged for the German steamship "Andalusia," which has been interned in Manila, Philippine Islands, since the beginning of the war, to be placed on berth from Hongkong and Nagasaki to carry rubber, hides, gunnies, etc., to Seattle, Washington. The ship will load at Singapore and probably be ready to leave during the latter part of August.

The former Hamburg-American Line steamship "Andalusia" was built in 1896 and is of 5,433 gross or 3,371 net tons. For insurance purposes she is rated first class. Inquiries regarding freight space, etc., should be addressed to Frank Waterhouse & Co., Seattle, Washington.

CHEMICALS IN LICENSED EXPORT LIST.

PRESIDENT WILSON issued a proclamation July 15, declaring it unlawful to export certain indispensable commodities from the United States, unless licensed to do so. Among the materials so prohibited, named in a revised list published July 22 by Secretary Redfield, may be noted chemicals and ingredients used in the rubber industry, as follows: Benzol, toluol, naphtha, benzine, gasoline, corn oil, linseed oil, ammonia salts, rosin, sulphur and turpentine.

It is more than likely that other materials may be placed on this list under future executive proclamations. Among them it is thought that cotton and its manufactures are likely to be included.

Applications for licenses may be made to the Bureau of Foreign and Domestic Commerce, Division of Export Licenses, 1435 K street, Washington, D. C., or to any of the branches of the Bureau of Foreign and Domestic Commerce—New York, Boston, Chicago, St. Louis, New Orleans, San Francisco and Seattle.

In applying for a license to export any of the commodities covered by the President's proclamation, applicants should give the following information in triplicate form:

- a. Quantity.
- b. Description of goods.
- c. Name and address of consignee.
- d. Name and address of consignor.

The license will be good for only 60 days and at the expiration of that time must be renewed, and if not shipped within that time a new application must be made.

The various branch offices of the Bureau of Foreign and Domestic Commerce have been given full instructions as to the disposition of all applications for licenses.

It is the desire of the Bureau of Foreign and Domestic Commerce to minimize the exporter's difficulties as much as possible, and therefore wherever practicable the district offices will be authorized to issue the licenses. It is thought, however, that many of the applications may have to be forwarded to Washington for decision.

The exporter receives his license in duplicate, and turns both copies over to the steamship company in exchange for a steamship permit. The steamship company turns both the original and duplicate over to the customs authorities with its clearance papers.

Difficulties arising where the goods covered by a license are not forwarded in one lot will be settled in one of several ways. In the first place, a man may apply for and receive as many licenses as he requires. A "balance license" is being arranged for, to take care of any balance of goods which has not been shipped under the original license. A "blanket

license" is being arranged for which will cover specific commodities shipped by specific firms to certain countries.

In the case of shipments to Canada, exporters are advised that steps have been taken to facilitate these shipments, and they need not apply for a specific license. Shipments to Canada may be forwarded as heretofore.

TOURING BUREAU INDICATES STRATEGIC ROADS.

SINCE the War Department has decided to purchase 70,000 trucks for the transportation of troops and supplies, military officials are busily engaged in choosing the best available routes between important points. The Goodrich National Touring Bureau which has carefully mapped, logged and guide-posted every principal road in the United States, recently offered the government complete access to its resources, and military inspection tours of strategic routes are already being conducted. Not long ago Captain O. R. Bird, U. S. N., with a sergeant, a corporal and a driver, dashed from Salt Lake City, Utah, to Los Angeles, California, in 34 hours and 14 minutes, proving that the new Arrowhead trail is the shortest route.

GERMAN GERMS IN PLASTERS.

THE statement issued by the Department of Justice that court and sticking plasters are being investigated for germs of infectious diseases placed there by German agents will startle some of the rubber manufacturers whose product is of the plaster kind. A large business is also done in porous plasters and corn plasters, the basis of the adhesive compound being india rubber. This is often compounded with medicaments for a variety of beneficent purposes. Instead of curative compounds it would be quite possible to substitute poisons. Nor would those who put powdered glass in Red Cross bandages hesitate in such wanton devilishness were the opportunity to occur. So watch their steps.

SIAM DECLARES WAR.

The kingdom of Siam, at the northern end of the Malay Peninsula, which for the ten months ended April 19 shipped 13,456 pounds of Para rubber and 12,533 pounds of gutta percha through the port of Singapore, has declared that a state of war exists with Germany and Austria. Nine steamers, aggregating 109,000 tons, have been seized. All Germans and Austrians have been placed under arrest and their places of business closed. The object of Siam's declaration is to "uphold the sanctity of international rights against nations showing contempt for the principles of humanity and respect for small states."

BREAKING THE FREIGHT CAR SHORTAGE.

Realizing that any feasible means to relieve the present freight situation will prove of benefit to the government as well as to business in general, the Railway Business Association of New York is promoting a widespread campaign among the trade associations and leading business houses of the country to break car shortage. Model forms are being distributed which are now in successful use by several concerns and deserve wider adoption. These include a blank for the shipper's weekly inbound loading and detention record, and a circular to the shipping department to be signed by the president of the company and setting forth the aims and means as follows:

What we can do:

(a) Get fuller carloading. The limit is 10 per cent above stencilled weight capacity.

(b) Increase excess of credits over debits. Don't use all your free time; load or unload earliest possible moment.

How we can do it:

1. Install forms similar to the attached and keep for each car loaded or unloaded a record of performance.

2. Talk often with our employes about this patriotic opportunity.

3. Report to me monthly for conference showing comparison with previous month and with corresponding month a year ago where data are available. This comparison should show average weight of carload and average pounds short of full carload inbound and out-bound, total credits, total debits, and total demurrage, names of consignors who have habitually underloaded, names of consignees who order short carloads.

4. Write for cooperation of consignors in fuller carloading and consignees in ordering full carloads.

Rubber companies should be willing to lend a hand in this important movement.

A TRUCK TIRE TEST.

An important question at the present time is whether solid or pneumatic tires are better for army trucks in the severe service which is required of them under war conditions. A practical test was recently made by the United States Tire Co., New York City, which certainly shows that the pneumatic tires are efficient and will stand service under the most difficult conditions. A 1½-ton Packard truck, heavily loaded, in fact, overloaded, equipped with 36 by 7-inch U. S. Nobby Tread pneumatic cord tires, was sent from Detroit, Michigan, to the Mexican border at Mission, Texas, a distance of 2,037 miles, and returning by a different route, completed the run of 4,288 miles. The trip was in regions where good roads were unknown, frequently plowing through 12 to 14 inches of soft clay, and in other places roads of intermixed mud and sharp stones were encountered. The intense heat of the desert had no apparent effect on the casings which resisted the cutting stresses of sharp rocks and the impacts of rock-bottomed streams. The test was made under the supervision of First Lieutenant J. W. O'Mahoney, formerly a United States motor truck transport expert, who since he was mustered out of the Federal service has continued his study of army transportation. The test seems to prove that pneumatics have some advantages over solid tires for trucks in heavy service.

RECREATION TENTS FOR OUR SOLDIERS.

The Tucker Duck & Rubber Co., Fort Smith, Arkansas, has received a contract from the international committee of the Y. M. C. A. for \$10,000 worth of tents, 40 by 80 feet, to be used in recreation places to be established for the benefit of American troops.

PRODUCTION OF ACETIC ACID IN CEYLON.

In view of the large quantities of acetic acid needed in the coagulation of latex, distillation experiments have been made with coconut shells and vera or virai wood. The results from the former were so satisfactory—the yield being 8 to 12 per cent of pure acetic acid, besides creosote, useful for smoked rubber—that many planters who grow both rubber and coconuts have installed small stills for distilling coconut shells and now produce all the acetic acid they need. Vera wood, the product of a shrub, yielded 4.14 per cent of pure acetic acid. The crude liquor could be utilized in the manufacture of smoked sheet or the darker rubbers; by redistilling it, after the addition of fresh charcoal, a pale yellow, clear solution of acetic acid was produced and could be employed for ordinary crêpe rubber. The erection of a small plant for the distillation of vera wood is being considered.

THAT RUBBER IS IN CERTAIN RESPECTS STRONGER THAN STEEL IS indicated by a unique test made at the Diamond tire factory. A sand blast under enormous pressure was blown on a piece of rubber and a piece of steel. The rubber actually outwore the steel three to one.

Bowers' Specific Gravity Tables.

THE determination of the weight of rubber articles is a matter of calculation well known to every rubber mill superintendent. It is upon these figures that factory costs are based and are therefore fundamental factors in the manufacture of mechanical rubber goods. According to the usual method the respective volumes of the articles to be produced are computed. Then the weight is determined for each article according to the specific gravity of the particular stock to be used in the goods. These determinations require a high order of technical as well as practical knowledge in the calculation of dependable figures. Moreover, the amount of time consumed is considerable, and human fallibility ever supplies the possibility of costly error in making complex computations.

A set of tables has been carefully designed to simplify the necessary calculations in determining the weights in ounces or pounds of rubber solids of regular dimensions, including disks, cylinders, square strips and sheets. As a short-cut method these tables will be of decided value to superintendents of rubber mills and by their use intelligent salesmen will be able promptly to answer customers' questions regarding the weight of a desired article.

The complete table with instructions, and several concrete examples of the method to be observed in computing the weights of disks and kindred articles are here shown. The tables for cylinders, square strips and sheets will be published in subsequent issues.

Various bases are used to reduce the number of decimals and still retain a true proportion throughout the table.

The stated base of the disk table is 62.40 pounds per cubic foot. The unit used is .000001731 ounce, equals a disk 1/64 in. diameter 1/64 in. thick—Specific gravity 1.00.

$$\frac{.000001731 \text{ ounce} \times (12 \times 64)^3}{.7853982 \times 16} = 62.40 \text{ pounds.}$$

Weight of one cubic foot of water—39.1° F. (maximum density)—62.425 pounds. (Kent, 1916 edition, page 27.)

To convert disk table into weights according to above standard, multiply by 1.0004+, or divide by 0.99958+.

The disk table is constructed to read from 1/64 in. diameter to 48 in. diameter (and above) as follows:

1/64 in. to 2 in. by 64ths in ounces
1/32 in. to 6 in. by 32nds in ounces
1/16 in. to 12 in. by 16ths in pounds
1/8 in. to 24 in. by 8ths in pounds
1/4 in. to 48 in. by 4ths in pounds

The volumes of two similar solids are to each other as the cubes of their linear dimensions. (Kent, 1916 Edition, Page 62.)

1 1/64 in. = .007313475 ounce	
2	4
1 1/32 in. = .029253900 ounce	
2	4
4 1/16 in. = .117015600 ounce = .007313475 pound	
2	4
8 1/8 in. = .029253900 pound	
2	4
16 1/4 in. = .117015600 pound	

The scope of the disk table is partly shown in the following examples that are intended to demonstrate the method employed when using the table which will be found on another page. The samples selected for computation include gaskets of two different sizes, a square flange ring, a valve, a washer, a ball valve and corks and plugs.

SAMPLE.

Gasket—45 1/4 in. diameter, 41 in. hole, 1/8 in. thick, Specific Gravity 1.62.

COMPUTATION.

45 1/4 in. = 11 5/16 in.	=	.056709291 pound
41 in. = 10 1/4 in.	=	.046556976
		.010152315
		16
		60913890
		10152315
45 1/4 in. x 41 in. x 1/64 in.	=	.162437040

REDUCING THE LABOR TURNOVER.

"New Men for Old, the Hiring and Firing Problem in Industry," is the title of an article by Lillian Erskine and Treadwell Cleveland, Jr., in "Everybody's Magazine," and reprinted for distribution by the Chamber of Commerce of the United States of America, that merits the attention of every employer, especially at this time when the war has forced the great cost of the labor turnover into prominence. Never has there been a better exposition of the cost of this turnover in instruction, damage to equipment, lowered production and spoiled work, nor of where the blame rests. A convincing case is argued for the fact that the real product of a factory is not materials but men, and 16 essentials are stated for standardizing the turnover and reducing it to the minimum. A study of the means advocated as tending toward the elimination of this costly economic and social waste indicates that leading American rubber industries have already adopted many of them with gratifying results.

RUBBER HEELS AT THE SHOE FINDERS' CONVENTION.

THE National Leather & Shoe Finders' Association held its regular convention at Milwaukee, Wisconsin, July 10, 11 and 12. A portion of its session included a meeting of the Rubber Heel Club of America, which is composed of manufacturers of rubber heels and soles, the special purpose of this club being to bring about a spirit of cooperation among these manufacturers and to further the sale and use of rubber in place of sole leather.

Robert H. Cory, of the O'Sullivan Rubber Co., New York City, president of the Rubber Heel Club, stated that it is estimated that 10 per cent of the residents of New York City wear rubber heels. Allowing for the consumption of three pairs of heels per year per wearer, and applying these figures to the population of the country at large, disclosed the possibilities of merchandising 30,000,000 pairs of rubber heels annually through the country.

George A. Stetson, of the Elastic Tip Co., Boston, Massachusetts, the secretary of the club, reported that a great deal has been accomplished in promoting amicable relations between the members of the club and the Finders' Association and that he felt certain that as the work of both bodies became better understood, greater progress would be made in the future.

C. H. Oakley, of the Essex Rubber Co., Trenton, New Jersey, a director of the Rubber Heel Club, stated that the relations between the rubber heel and shoe finders' organizations had been established on a most satisfactory basis. The members of the Rubber Heel Club met several times during the year and the result has been that relationships have been established so that three-quarters of all the manufacturers of rubber heels discuss their trade problems with the utmost freedom and candor. He said that only by the elimination of wasteful manufacturing and foolish business methods can it be possible for merchandise of acceptable quality to reach the consumer with a fair margin of profit to all parties concerned in the trade.

During the convention the following resolution was passed by the National Leather & Shoe Finders' Association:

Resolved: That the National Leather and Shoe Finders' Association endorses and approves of the organization purposes and methods of the Rubber Heel Club of America and urges co-operation with its efforts to create and extend the use of rubber heels and to further the mutual interests of manufacturers, distributors and users of rubber heels.

An important action at this convention was the appointment of an educational committee and the raising of a sum of over \$20,000 for an educational campaign, to be carried into effect by an educational director to be appointed by this committee.

A feature of the convention was the address of Frank W. Whitcher, a leading Boston shoe findings manufacturer and jobber, and proprietor of the Velvet rubber heels, whose analysis of the present trade situation was very thorough, and instructive. Mr. Whitcher is an ex-president of the Finders' Association and for several years held the office of treasurer, resigning at this session because of the pressure of his duties in connection with the National Chamber of Commerce.

VENTILATED RUBBER COATS?

NOW it is an acid-proof textile fabric that is wanted; this to be used for the clothing of workmen employed in chemical plants producing, or using, acids. Cotton and other vegetable fibers are useless, and wool fabrics disintegrate very quickly. Rubber effectively resists the strongest mineral acids, but rubber suits are not comfortable and rubber is therefore used only for gloves and boots. Perhaps a wool cloth impregnated with rubber in such a manner as to render it sufficiently pliable, and yet wear-resisting, may be developed. [Textile World Journal.]

What the Rubber Chemists Are Doing.

SYNTHETIC RUBBER.

IN a comprehensive article in "Metallurgical and Chemical Engineering" (May 1, 1917), Andrew H. King illustrates the possibilities should synthetic rubber be obtainable commercially, by comparison with the case of synthetic indigo, which has completely displaced indigo from natural sources.

The present state of knowledge on the structure of the caoutchouc molecule is given in historical review, following by formulas, discussions of polymerization, methods of preparation of butadiene, condensation, opening the benzene ring, fermentation and dehydration.

This is the concluding article of a series of three, the object of which is to point out that if the seas are ever closed for the importation of our rubber supply there are only three ways to protect ourselves.

1. Cultivate and harvest guayule by scientific methods.
2. Develop something from milk weed or related plants.
3. Work up a good synthetic rubber.

METHODS FOR TESTS OF CHICLE.

The following methods by Dr. Frederic Dannerth are condensed from "The Journal of Industrial and Engineering Chemistry" (July, 1917).

Chicle is valued on the basis of the following factors: (1) Contained moisture; (2) shrinkage, when cleaned of dirt and bark; (3) chewing quality of purified chicle; (4) color of the crude chicle.

Typical analysis of Yucatan chicle:

	Per Cent
Acetone soluble matter (resins).....	40.0
Gutta and carbohydrates.....	17.4
Proteins.....	0.6
Sand and foreign matter.....	2.3
Water.....	35.0
Mineral matter (ash).....	4.7

Crude chicle is sampled by cutting one pound from the block. This is rapidly cut into half-inch crumbs and stored for test sealed in a "Lightning Jar." Wet chicle cannot be thus stored more than one week, as molds grow rapidly, especially in the dark.

MOISTURE.

A half grain of crude chicle is dried in an air bath about five hours and not exceeding 50 degrees C. A glass dish two or three inches in diameter with ground glass lid is used for the sample. Fusion retards evaporation of the water. Drying is complete when two consecutive weighings agree within one-half per cent.

Moisture in crude chicle may be determined simultaneously with the resins. Boiling acetone removes resins and water from the sample. The extract in the flask is dried at 105 degrees C. and the residue in the thimble is dried in a similar manner. The sum of these weights subtracted from the weight of the original sample represents water. This method for determining moisture is preferred in practice.

VISCOSITY.

Kerosene (boiling point above 140 degrees C.) is used as the solvent as the loss by evaporation is negligible. Commercial chicle must be dried for 12 hours in a vacuum at not exceeding 70 degrees C. before solution.

Twenty grams of dry chicle, weighed to tenths of a gram, are placed in a wire basket fitted for a "Joint Rubber Committee" extraction apparatus. In the flask are placed 75 cc. of kerosene. The basket is made of 100-mesh wire gauze and retains any gritty and fibrous matter. The kerosene-chicle solution is diluted with kerosene to a concentration of 20 grams of strained chicle in 100 cc. of liquid. After cooling to 20 degrees

C. its viscosity is determined in a Stormer viscosimeter (THE INDIA RUBBER WORLD, December 1, 1916) and the result expressed in revolutions per minute.

RESINS.

The chewing quality of chicle is due to the presence of resins of suitable melting point. Mexican chicle has resin contents averaging 60.8 per cent of the dry chicle.

ACETONE SOLUBLE MATTER. Five grams of crude chicle, granulated to pass through one-eighth mesh screen, is extracted five hours in a Joint Rubber Committee extractor with acetone of boiling point not higher than 65 degrees C. The evaporated extract is dried to constant weight at a temperature not above 105 degrees C., cooled in a desiccator and weighed. The residue is dried at 85 degrees C. If the acetone solution is allowed to cool before distillation a large part of the resins separate out as a wax-like incrustation. After all the acetone is expelled and the temperature reaches 105 degrees C. the residual resins appear quite clear and amber colored.

MINERAL MATTER.

One to two grams of dry chicle are incinerated in a crucible inserted in an asbestos shield. The organic matter is volatilized at low temperature without ignition, after which the carbon is burned off as usual.

COLORED SPOTS ON RAW RUBBER.

B. J. Eaton, in the Agricultural Bulletin of the Federated Malay States, discusses the development of chromogenic organisms in dry rubber allowed to become damp. The colored spots referred to are designated as "spot disease" and have been determined experimentally to be due to the growth of chromogenic organisms induced by either rain or sea water wetting. Ten days after wetting dry, clean pale crêpe considerable development of colored organisms occurred, resulting in patches of orange, blue and yellow on the rubber. Dry, well-smoked sheet rubber may develop mildew on the surface for similar reasons, while low-grade rubbers may ferment and become tacky.

The author notes several interesting observations in the course of his investigations on the development of chromogenic organisms in rubber. No development of pigment occurs in "slab" rubber, which is slightly pressed coagulum, until the slab is cut open, when pigment develops on the cut surface after a few days. If sheet rubber is rolled into a cylinder straight from the sheeting machine, no development of pigment takes place until the sheet is cut open, when pigment develops on the cut surface. When wet, thin crêpe is rolled into a cylinder there is invariably a great production of pigment due to the growth of these organisms. From these experiments it seems that the presence of air is necessary for the development of chromogenic organisms, and this is excluded in rolled sheet or slab rubber. Also it is probable that an excess of moisture may retard or prevent the formation of the pigment, and that the pigment forms later with the reduction of the moisture.

VALUATION TESTS OF CRUDE RUBBER.

Scientific and rule-of-thumb valuing of plantation rubber have recently been compared by J. G. Fol for the Dutch Rubber Congress. The report of the investigation is published in the report of Department of Agriculture, Manufactures and Commerce, under the title of "Mededeelingen van dem Rijksoverheidsdienst ten behoeve van den Rubberhandel en de Rubbernijverheid te Delft." There were 137 specimens, 36 samples of sheet, all but one of which were smoked, and 101 samples of crêpe, six of which were thick blanket. These were all judged in an empiric way by the producers and their conclusions reserved and com-

pared after completion of the scientific tests made without knowledge of the first results.

Empiric judging of rubber depends largely on color, smell and stretch. These tests at best are only roughly approximate, although the rubber expert by means of them can distinguish marked differences in quality. It is a mistake to presuppose that mechanical properties of the rubber when vulcanized run parallel to color, smell and stretch in the raw state. Variations in physical condition do not permit hand pulled tests nor quantitative expression of value. The influence of temperature variations are also marked.

Smoked sheet cannot be judged better by rule of thumb than crêpe. Its color denotes only the degree of smoking. Sheet is easier judged as to its mechanical properties than crêpe.

Black rubber presents the most difficulties for empiric judgment as it cannot be subjected to a hand test.

Scientific methods obviate these objections because each sample is suitably prepared and tested quantitatively. The 137 samples under investigation were examined after the following scheme:

A. CHEMICAL ANALYSIS:

1. Moisture.
2. Resin.
3. Ash.
4. Nitrogen calculated as albumen.
5. Rubber.
6. Acetic degree.

B. VISCOSITY NUMBER.

C. VULCANIZATION AND PHYSICAL TESTS:

1. Tensile strength.
2. Elongation.
3. Permanent set after 24 hours at 400 per cent stretch measured after six hours' rest.
4. Temporary set measured directly after release from 400 per cent stretch.
5. Determination of load necessary to stretch sample 400 per cent (kilograms per square centimeter).
6. Difference of the load necessary to stretch sample 400 per cent and that required for the last of five successive 400 per cent stretchings.
7. Elasticity or rebound.
8. Coefficient of vulcanization.

Concerning the importance and correlation of these determinations, it is concluded: (1) Chemical analysis is not sufficient alone for judgment of the rubber quality. Properties of rubber are chiefly determined by the physical nature of rubber and the rubber molecule. The quantitative chemical differences are not enough to account for the large differences found in the physical properties; (2) in general a high viscosity indicates good mechanical properties of the rubber after vulcanization. However, the opposite must be assumed with some reservation, since in studying the relation between the viscosity and tensile strength it appeared that various samples with a low viscosity had a very high tensile strength. The samples that exhibited this relation were almost exclusively smoked sheet. This phenomenon is caused by the fact that it is very difficult to dissolve smoked sheet in benzol completely. The dissolved part has a low viscosity and presumably contributes little to the excellent qualities shown by the sample after vulcanization, while the very considerable amount of undissolved rubber apparently is the most valuable part of the sample and most probably causes the good properties after vulcanization.

The *Voorlichtingsdienst* (Information Service) has taken the position that rubber which possesses good mechanical properties under certain normal vulcanization conditions, is better than that which may show these good properties only after prolonged vulcanization. It thus had to base judgment of the samples sent in on a determination of the mechanical qualities and of the coefficient of vulcanization of the rubber vulcanized according to a standard method.

Test samples for vulcanization were prepared with seven and one-half per cent of sulphur and were vulcanized one and one-half hours at three and one-half atmospheres.

The tensile strength, permanent set after stretching 400 per cent and the coefficient of vulcanization were taken as quantities suitable for classifying the samples. These quantities are closely related. Thus, high tensile strength generally accompanies high coefficient of vulcanization and low permanent set. Elongation at break also indicates the quality of the rubber; of samples equally loaded, that is, the best which has the highest elongation at break.

The remainder of the physical tests made were set aside as practically valueless for the end in view.

One of the most important points demonstrated by this investigation is the lack of uniformity in First latex rubber. The greatest divergencies were found in viscosity, tensile strength, permanent set and the coefficient of vulcanization. The causes of this lack of uniformity and its prevention is one of the most important problems of the rubber industry.

The rubbers investigated were classified as follows:

Class.	Breaking strain (kilograms per sq. c. m.)	Permanent set.	Coefficient of vulcanization.
I	135 k. g. and over	Maximum 5%	Minimum 5
II	120 k. g. to 135 k. g.	5% to 7%	Minimum 4
III	90 k. g. to 120 k. g.	7% to 12%	Minimum 3
IV	80 k. g. to 90 k. g.	Over 12%	Below 3
V	Below 80 k. g.	Over 12%	Below 3

The division of the 137 samples among the different classes is indicated below:

Class.	Sheet.	Crêpe.	Blanket.
I	17*	3	0
II	12	21	3
III	7	51	2
IV	0	11	1
V	0	9	0
Totals	36	95	6

* One sample unsmoked.

These figures demonstrate clearly that, in general, smoked sheet is better than crêpe. However, there are samples of crêpe that are equal to smoked sheet as far as mechanical properties are concerned. The number of samples of blanket is too small to permit a decisive conclusion but the figures would indicate that blanket is inferior in quality to smoked sheet and often also to crêpe.

The empiric judgment of the rubbers by the contributors varied considerably in method. Seven contributors only, out of 15, sent in their judgment. Some arranged the rubbers in groups, others graded them and one sent the market values. From the last method it is seen that according to the prevailing system inferior crêpe is valued as highly as the best crêpe.

Lack of uniformity in plantation rubbers reveals itself chiefly in the difference in rapidity of vulcanization. Two rubbers outwardly of absolutely equal value may produce entirely different results after vulcanization. Empiric judgment cannot tell how a rubber will behave during vulcanization, hence the estimate of value is liable to be incorrect. This causes much uncertainty and disappointment to the manufacturer.

Another disadvantage which will be removed by the introduction of scientific methods of inspection is the putting together of equal lots of rubber coming from different plantations and possessing widely divergent properties.

The main advantages of the scientific system of grading rubber will be, (1) relatively better prices, especially of classes II and III, in comparison with those of hard fine Para; (2) improvement of the product of a good many estates, the managers of which grope in the dark at present; (3) increased use of plantation rubber, certain qualities of which are already as good, if not better than hard fine Para.

INFLUENCE OF PIGMENTS ON RUBBER.

In an article on pigments in rubber ("Journal of Industrial and Engineering Chemistry," July, 1917) Dr. Maximilian Toch states the nature and chemical effects on rubber of active compounding ingredients or "reinforcing pigments," such as antimony sul-

phide, litharge, sublimed zinc, lead, zinc oxide, lithopone, precipitated barium sulphate, carbon blacks and a few other well-known materials.

RUBBER IN AIR BRAKE AND SIGNAL HOSE.

The Master Car Builders' Association specifications for air brake and signal base prescribe standard methods of test and maximum and minimum test requirements as follows:

FRICTION.

The quality of friction rubber must be such that a 20-pound weight will not separate the duck plies of a one-inch wide section of hose more than eight inches in ten minutes.

TUBE AND COVER.

STRETCH. Specimen one-half inch wide, gage marks two inches, is stretched twice to 800 per cent, re-marking two inches between stretchings and held stretched ten minutes the second time. After this treatment the rubber may show not over one-quarter inch temporary set and one-eighth inch permanent set between gage marks.

TENSILE STRENGTH. Specimen one-half inch, gage marks two inches. Breaking strength, minimum 800 pounds; maximum, 1,200 pounds per square inch.

METHOD OF ANALYSIS.

ESTIMATION OF MINERAL MATTER IN VULCANIZED RUBBER.

TWO grams of the sample are placed in a 300 cc. flat-bottom flask and covered with 50 cc. nitro-benzene. Connect the flask with a reflux air condenser (Hopkins preferred). Heat the flask until the rubber is completely dissolved, then allow the apparatus to cool. Dilute the contents with acetone, constantly stirring with a glass rod. Let stand for at least one hour to precipitate all mineral matter out of solution. Decant and transfer all to a filter paper and wash with acetone, then with alcohol. After a slight wash with water, dry at a low heat, weigh and calculate the percentage of mineral matter in the two grams of sample. The above method is by A. W. Jones, Jr., in "The Chemist-Analyst" (January, 1917).

CHEMICAL PATENTS.

THE UNITED STATES.

RUBBER VULCANIZING PROCESS. Adding to a mixture of rubber and sulphur, as an accelerating substance, a base of the aromatic series in which the anilin function or radical is in position para, with another radical or with the atom of carbon or triphenylmethane, and heating. [Etienne de Meeus, Beacon Falls, Connecticut, assignor to Beacon Falls Rubber Shoe Co., Boston, Massachusetts. United States Patent No. 1,229,724.]

LIQUID RUBBER COATING COMPOSITION. A liquid coating composition comprising Para rubber, gasoline, petroleum, oil of turpentine, linseed oil, China wood oil, white lead, red lead, sulphate of zinc and lead acetate. [Siegmond Jacobs, assignor of one-third to Charles Petrask, both of Cicero, Illinois. United States Patent No. 1,229,964.]

WATERPROOF COATING. A waterproofing composition comprising a mixture of asphalt, carnauba wax, ceresin, aluminum oleate and castor oil dissolved in or softened by a volatile solvent combined with a filler of finely divided Portland cement. [William H. Adams, Kenyon, Rhode Island. United States patent No. 1,231,687.]

WATERPROOF FILLER. A liquid waterproofing filler comprising in a combined mixture of forty-five parts, rubber cement, 4½ parts; paraffin wax, 1½ parts; turpentine, 2 parts; varnish makers' naphtha, 35 parts, and tri-chlorethylene, 2 parts. [Lewis A. Coleman, assignor to American Chemical & Manufacturing Co.—both of Norfolk, Virginia. United States patent No. 1,233,190.]

THE UNITED KINGDOM.

GUTTA PERCHA AND RUBBER SUBMARINE CABLES. Submarine telephone cables are insulated by gutta percha which has been partly or wholly detersinated and mixed with natural india rubber or its synthetic substitutes. [Felten & Guillaume Carlswerk Akt.-Ges., 24 Schangenstrasse, Mulheim-on-Rhine, Germany. British patent No. 105,573 (1917).]

VULCANIZING INDIA RUBBER. India rubber and its compounds and oil substitutes are vulcanized by means of finely ground oil shale. The sulphur in the shale acts as a vulcanizing agent, the hydrocarbons improve the product, and the siliceous matter acts as a filler. [G. E. Heyl, King's House, Kingsway, London. British patent No. 105,831 (1917).]

SWEDEN.

CAOUTCHOUC FROM BEARBERRY SHRUB (*Arctostaphylos uva-ursi*). The shrub is first extracted with water to remove tannin, dried and the caoutchouc removed by solution in benzene, ether, carbon bisulphide or other solvent and precipitated. [E. W. Tillburg, Swedish patent No. 42,227 (March 21, 1917).]

LABORATORY APPARATUS

DEVICE FOR BURETTE READING.

A SIMPLE and easily made device for use in reading burettes is that originated by C. B. Clark, chemist of the Somerset Rubber Reclaiming Works. It is made in the form of a short half-cylinder of wood grooved to fit an ordinary burette. One half the groove is lined with white glazed paper and the other half with black glazed paper. A flat mirror, about three-quarters of an inch square, is set flush into one edge of the flat side, and is spaced equally with relation to the black and white lining of the burette groove. The method of use is indicated in the cut. The white section is applied against dark solutions and the black against light ones. The function of the mirror is to reflect light on the meniscus and graduations, thus rendering the reading of the scale very accurate, which is a very difficult matter in certain instances.

A—BURETTE; B—WHITE GLAZED PAPER; C—WOOD BLOCK; D—MIRROR; E—BLACK GLAZED PAPER.

FILING CABINET.

A very useful and convenient laboratory cabinet or filing system for chemicals, specimens and test pieces, known as the Schwartz Sectional System, is here illustrated. This arrangement keeps the materials filed in perfect condition, in a third of the usual shelf space. The contents of the cabinet are listed in a loose leaf index, reference to which instantly locates the chemicals or samples desired. [Indianapolis Drug Cabinet Co., Indianapolis, Indiana.]

New Machines and Appliances.

MACHINE FOR STAMPING NUMBERS ON METAL.

THE difficulty of obtaining metal specialties of various sorts, due to the congestion of orders in the metal industry, has been a serious handicap to many rubber mills. When the

necessity is urgent the manufacturers have been forced to supply their own requirements that were formerly obtained from makers of metal specialties.

As a case in point, the thin strip of tin or aluminum that is numbered consecutively and used in the molds for reproducing the number of the tire, may be made by the machine here shown. It is constructed on the same lines as a sub-press and is used in connection with an ordinary

power punch press. This machine will automatically emboss consecutive numbers on thin, soft metal, either on separate pieces or from a roll.

The numbering wheels are constructed on the principle of male and female dies and as the strip is automatically fed between them a raised number is formed on the metal at each stroke of the press. The numbering heads may also be constructed with any number of wheels and a letter wheel to follow or precede the number is supplied if so desired. Moreover, the machine can be constructed to duplicate or triplicate each number. [Wetter Numbering Machine Co., 255-61 Classon avenue, Brooklyn, New York.]

THE DOUBLE CONE VISE COUPLING.

The old-fashioned flange coupling is now seldom used, as it requires particular fitting to its individual shaft, must be tightly forced in place permanently and cannot be used on shafts in connection with other than split pulleys or open hangers. The modern type of compression coupling that possesses none of these objectionable features is here shown and has been specially designed to meet the particular requirements of rubber mill practice.

There are three principal parts—the outer sleeve or shell and two inner bushings or cones. The shell has its interior surfaces bored like the frustrums of two cones, having one continued axis. Into these are fitted the two cones, which have been previously bored of standard size to suit the shafts. When in place the axes of the cones must be coincident with that of the shell, thus under all conditions keeping the two shafts that are connected in true axial line, an exclusive feature of this coupling. The inner ends of the cones do not come together, their relative position being regulated by their external contact with the inner surface of the shell and their internal pressure upon the shafts to be coupled.

The shells have three equidistant longitudinal slots in their inner surface, while the cones have corresponding slots in their outer surface, through the bottom of which there is cut a narrow additional slot, which extends through to the bore, thus

parting the cone on this side. Into these main slots are pocketed the bolts, which serve alike to draw the cones toward each other and to prevent their turning in place.

The attachment and operation are readily understood. When the various parts have been placed—by hand—in proper position on the shafts, the bolts are inserted and gradually tightened. This screwing of the bolts exerts an equal pressure upon both cones, and as they are drawn along the inclined walls of the shells they are compressed, and exert a vise-like grip upon the entire circumference of the shafts to be coupled. As a slight drawing of the cone within the shell will make a perceptible compression of its diameter, and a subsequent contraction of its bore, it is evident that the shafts do not require to be fitted to the couplings, and that variation in the exact sizes of the shafts does not distort their true alinement.

When the cones or their key seats become worn, the substitution of new cones renders the coupling practically new in every respect. [William Sellers Co., Inc., Philadelphia, Pennsylvania.]

ACID PROOF VALVES.

In the early days of the rubber reclaiming industry porcelain cocks were used on the acid lines in place of valves. These being exceedingly fragile it was necessary to provide some sort of covering to protect the porcelain against breakage. Therefore, they were enclosed in a lead casing and melted sulphur was poured into the space between the lead envelope and the porcelain cock to strengthen them. These valves gave satisfaction for some time, but were found to be still too fragile, as the plug was often fractured, in which case both plug and seat had to be replaced at considerable expense.

A trial was then made with the regular type of cast iron cock. This proved to be satisfactory for a while, but eventually the plug became stuck or "frozen" in the valve body owing to the corrosive action of the acids.

Valves that comprised a metal body lined with special acid-

resisting metal of the nature of lead were not altogether satisfactory, due to the difficulty of keeping the seat tight and the frequent trouble occasioned by the stem sticking in the body of the valve.

Fairly satisfactory results have been obtained by using the ordinary ammonia valve in which the steel disk usually furnished with these valves is substituted by a disk filled with soft lead that is easily renewed when it becomes worn and leaky.

In view of the evident difficulties in obtaining a suitable material for acid-resisting valves, it is interesting to note that a comparatively new alloy has been used with great success for this purpose. It is known as "Duriron," and is claimed to be impervious to the action of

nitric, sulphuric, acetic and many other acids in all degrees of dilution.

Prior to the advent of Duriron—about five years ago—there was no single metal from which acid valves and other chemical apparatus could be made which would resist corrosive and erosive action. Duriron is a hard, close-grained metal having a particularly uniform quality, taking a fine finish, and being practically non-corrodible. Valve seats made of it will hold their original condition of tightness for an indefinite length of time.

In many cases plug cocks possess advantages over valves, because they are quick and simple to operate. The main objection to this liability to stick or "freeze" has been overcome by plug cocks made of this metal, as experience has proven that they seldom if ever stick.

Duriron is employed in the form of castings, and on account of its exceeding hardness, its finished surfaces are machined by grinding. Many useful implements, utensils, pumps, containers, etc., are made of this material. [Duriron Castings Co., Dayton, Ohio.]

SECTIONAL STEEL SHELVING.

During the past few years there has been a growing demand for strong, interchangeable and portable shelving suitable for use in the office or plant of a rubber mill. Wooden shelving has failed to be generally accepted and therefore the development in this material has been slow. Sectional steel shelving of unit

construction that is sold at a comparatively moderate price has proved very satisfactory for both office and factory use.

This shelving, known as "Multi-Unit" shelving, is built of extra heavy sheet steel with the idea of making it available for heavy duty service in factories and in places where the shelving would

receive more or less rough usage. It can be arranged in sections by the multiplication of any number of units. All of the units solidly interlock and all parts are interchangeable which allows the greatest variety of arrangement. Another feature is that the

shelves and uprights have tubular edges, which serve not only to add to its strength but give it a very attractive appearance, especially when it is finished in the colored enamels.

The shelving is supplied in plain steel so that it can be painted at will, or it is furnished in a finish of black or olive green enamel. The uprights have paneled sides and the shelving is furnished with paneled backs, when backs are desired.

At the present time the units are furnished in standard size, 36 inches long, 12 inches high and 12 inches wide, and the standard stack, which is being put out at present, is five shelves high, but this can be arranged in any way to suit the purchaser's convenience. [National Scale Co., Chicopee Falls, Massachusetts.]

THE DAFT FLEXIBLE COUPLING.

There are many installations of machinery in rubber and other mills where the solution of the power transmission problem requires a flexible coupling. This is particularly true in connecting up generators, either to direct drives from counter shafts or in motor generator sets where a flexible connection is necessary to allow the armature to float in its true field. Also, on the mill line where sudden

shocks are of such frequent occurrence and errors of alignment often occur, some sort of flexible coupling is considered indispensable. Applied to calenders, the torque is rendered uniform and backlash effectively precluded by a flexible element provided on the drive shaft.

The Daft coupling here shown is of particular interest, due to the fact that its flexibility and driving power depend on a specially compounded rubber medium of novel form. Two types of this coupling are made; one is articulated to permit installing without disarranging the line, and the other is of the integral or solid type. The dielectric property of the rubber connection used in these couplings affords perfect insulation when they are used in connection with direct driven motors or generators. [Rubber Insulated Metals Corporation, Plainfield, New Jersey.]

POWERS' TEMPERATURE REGULATORS.

The control of temperature is a vital necessity in the manufacture of dependable rubber goods. The maintenance of the required degree of heat during the period of vulcanization determines the effectiveness of the cure and depends in a great measure on the automatic devices used for controlling vulcanizing temperatures. Also in steam heated dry rooms for drying crude rubber, compounding ingredients, and varnished rubber goods, temperature regulations are indispensable.

A type of temperature control that is recommended for these purposes is here shown. The thermostat, or sensitive bulb, is arranged in the heated space and transmits the changing vapor pressures through a flexible armored tube to a metallic diaphragm located in the bonnet of the steam valve. The expansion and contraction of the bellows opens or closes the valve, thereby regulating the supply of steam to the heater or dry room. Adjustment for different temperatures is accomplished by changing the position of the weight that slides on the valve lever. In vulcanizer and dry room installations, where temperatures above 120 degrees F. are used, the thermostat is, of course, located within the heated space while the valve is arranged on the outside. In varnish drying rooms where a temperature of 120 degrees F. or less is to be maintained, the valve is located within the room.

Where it is necessary for any purpose to maintain a certain degree of humidity, the regulator shown in the lower illustration and designed for the control of liquid temperatures, is used. The thermostat in this case, however, is immersed in the heated water tank and transmits the changes in pressure to the metallic diaphragm that opens and closes the steam valve, thereby regulating the water temperature. [The Powers Regulator Co., 5 South Wabash avenue, Chicago, Illinois.]

MACHINERY PATENTS.

GAMMETER'S VULCANIZING PRESS.

THE prime object of this invention is to provide a mechanically operated elevator whereby the loading and unloading of molds used in the manufacture of mechanical rubber goods is greatly facilitated. The illustration, representing a side elevation of the machine partly in section, comprises the hydraulic cylinder *A* forming the base in which operates a ram that supports the movable platen *B* on its upper end. Seven hot plates are provided, the lower one shown at *C* resting on the lower platen while the uppermost plate *D* is attached to the upper platen. The intermediate plates have varying degrees of vertical movement and are provided with means for stopping the plates at predetermined distances from each other to permit the insertion and withdrawal of the molds. All the hot plates are chambered for steam and connected to the supply line by flexible joints. On opposite sides of the press are two elevator platforms, *E* and *F*, suspended by four vertical rods from the yoke

G that is fixed to the ram *H*, which reciprocates in the cylinder *I* mounted on the head of the press.

The press is opened by discharging the lower cylinder and the ram descends, thus opening the mold compartment. The press is then charged with the full complement of molds and pressure applied during the vulcanizing period. When the molds are to be changed

this may be effected with the aid of the elevators and by the operator on one side pushing an uncured mold into the compartment, thereby forcing out a cured mold onto the opposite platform. The molds may also be cured in pairs with overlapping curing periods, only two of the molds being changed at one time and the others remaining in the opened press, the substitution of the molds being greatly facilitated, meanwhile, by the movable platforms. [John R. Gammeter, Akron, Ohio, assignor of The B. F. Goodrich Co., a corporation of New York. United States patent No. 1,232,022.]

A SELF-CONTAINED TIRE VULCANIZING MOLD.

This novel mold is adapted to be used for building up the carcass of pneumatic tires and vulcanizing them without removal from the mold until the time has elapsed to effect the cure.

In the illustration, which shows a vertical section and an approximate section taken on the line *A, B, C* is the mold that is bolted to any convenient support and provided with heating chambers, *D* is the sectional core and

E the core expanding device comprising four adjusting screws.

In practical operation the various plies of frictioned fabric constituting the carcass are successively placed within the mold and shaped by hand and the heads applied. When this operation is finished the three straight sections of the core are mounted in place and finally the top or wedge-shaped section is introduced. The four screws of the expander being retracted, it is then located within the core, the heads of the screws alining with the channel grooves, and when the screws are expanded the core forces the casing against the walls of the mold. Any suitable means may be employed in curing, but in this instance electric heaters are introduced into chambers provided in the base of the mold for that purpose. [Fred Brown Pfeiffer, Akron, Ohio. United States patent No. 71,231,645.]

OTHER MACHINERY PATENTS.

PROCESS PATENTS.

PROCESS OF MAKING HEELS OR SOLES FROM SOLID TIRE SCRAP.

THE utilization of rubber scrap, such as solid tires, in the manufacture of rubber heels or soles and without further reclaiming, is the object of the present invention. The tires are first cut

into convenient lengths and clamped in a holder with the base portion exposed. This rough surface is ground off by an abrasive wheel, when the tire section is removed and placed in another holding device operating in connection

with a band saw that divides the tire longitudinally into slabs of suitable thickness. These flat strips are then delivered to the machine shown in side elevation and plan in the accompanying illustration. An endless conveyor belt *A*, moved intermittently by the ratchet wheel and hand lever shown on the right, carries the stock under a treadle-operated die press *B* that punches out the heel blank, but leaves it within the slab. As the slab advances each heel blank is branded with a heated die as it passes under the device shown at *C*, and the nail holes are finally

drilled by the multiple drill *D*, when the finished heels are carried from the machine by the conveyor belt. The periodic movement of this conveyor belt is obtained by a hand lever; the punching, branding and drilling operations are performed in unison by a foot treadle, while the drills are driven by a small electric motor. [Frederick D. Philip, Royal Oak, assignor of one-half to Allen A. Templeton, Detroit—both in Michigan. United States patent No. 1,230,510.]

POROUS RUBBER FABRIC. Open mesh fabric is coated and partially impregnated with rubber solution, after which the coating is perforated at the interstices by fluid pressure, the solvent evaporated and the rubber vulcanized. [Arthur B. Kempel, Akron, Ohio, assignor to The B. F. Goodrich Co., a corporation of New York. United States patent No. 1,229,284.]

MISCELLANEOUS PATENTS.

FRENCH RUBBER CUSHIONED WHEEL.

THIS is a wheel of the disk type that is evidently designed for military motor trucks, wagons and gun carriages. Referring to the illustrations, the wheel comprises a metal tire *A* that may be rubber shod, two side plates or disks *B* and two star-shaped pieces *C* that hold the four rubber cushions *D* and the rubber hub *E* in place. Metal rings encircle the four outer rubber cushions that are held in place by the two star-shaped pieces and four compression bolts. The rubber hub cushion is also provided with an outer metal band and is supported on the axle of the wheel by a metallic sleeve through which the axle bolt passes. [G. Constani. French patent No. 482,308.]

The affairs of the defunct Northland Rubber Co. were closed in the Supreme Court on July 17, when Justice Sears confirmed the receiver's report by which the creditors of the company will realize about 70 cents on the dollar, while the stockholders will suffer a total loss according to statements made to the court. The plant was recently sold to the Kelly-Springfield Tire Co. for \$270,000.

The Scioto Rubber Co., of Columbus, Ohio, has filed a damage claim against that city for \$24,500 based on the grade elevation of the railroad tracks at East Fifth avenue which has practically shut off means of access to the company's plant.

The Porter Rubber Co., Salem, Ohio, recently voted to sell \$110,000 of its treasury stocks. Funds realized will be devoted to an increase of capacity, the present output being 100 tires daily.

New Goods and Specialties.

"LIBERTY" BATHING CAP.

THE rampant tri-colors are attractively in evidence on one of the new bathing caps, shown herewith. The full-shaped red rubber body of the cap is gathered into a close-fitting band of blue, frilled at the top with white and decorated with white stars at intervals of about two inches, and a red rosette in the center of the front. [The Seamless Rubber Co., Inc., New Haven, Connecticut.]

THE "U-PUT-ON" RUBBER HEEL.

The rubber heel has until lately been made almost exclusively for low-heeled shoes, and was more suited to men's, boys' and children's footwear, or for the athletic type of women's shoes.

The small French or Louis heels worn by fashionable women presented a problem to the rubber-heel maker, but this is happily solved by the "U-Put-On" heel, which, as its name indicates, can be attached by the wearer, it being a sort of socket or tip which slips over, and clings tightly to the heel of the shoe. It can be readily trans-

ferred from one heel to another and adjusted to wear evenly. An arrangement of vacuum cups in the central portion prevents slipping. These heels are supplied in four sizes, suited to the various types of French heels, and in black, gray, tan or white colors. [Robert E. Miller, Inc., 11 Broadway, New York City.]

RUBBER PROTECTOR FOR NURSING BOTTLE.

Nursing bottles are very subject to breakage, either by unavoidable accident or as the result of the infant's throwing the bottle from the carriage or crib. An ingenious device recently placed on the market is a cage-like frame of soft white rubber, designed to protect the bottle from injury. This rubber frame can be boiled and sterilized without being removed from the bottle and is therefore convenient and perfectly sanitary. [J. E. Cosgriff, 347 Fifth avenue, New York City.]

AN OFFICIALLY TESTED TIRE FILLER.

There are many fillers on the market, designed to seal punctures in tires. It is a comparatively simple matter to make a material, which, placed inside the tube, will stop punctures more or less effectively, and for a longer or shorter time. But to discover or invent a material which will not cause any deterioration to the tube is a somewhat greater problem.

That this has been accomplished is the claim for Crew Levick Tire Seal, a semi-liquid material which has been severely tested officially by the laboratory engineer of the Automobile Club of America, a report of a certified test showing that the material did all that was claimed for it under tests which included driving

nails and leaving them in, driving other nails and immediately pulling them out, cutting with a penknife and allowing to heal, cutting larger slits and patching and vulcanizing. Even under such treatment pressure tests showed almost no loss of pressure in three days' runs, totalling almost 300 miles. It is claimed by the makers that this material is not harmful to tubes, but rather is really a preservative, and that tubes containing this filler will last longer than those without it. [Crew Levick Co., Philadelphia, Pennsylvania.]

IMPROVED AURAL ICE BAG.

The aural ice bag of improved design shown here is pronounced very efficacious in cases of mastoiditis. By means of an opening through the bag which allows it to fit under and around the ear, application is made directly at the point desired to be reached. Pure gum, in the natural gray color, is used in the manufacture of this aural ice bag, and a new patented clamp, of the snap-lock variety, is supplied with it. The mouth of the bag is closed by inserting between the folds of a metal plate and held in place by a metal frame, a simple pulling motion clamping it firmly together. [Davol Rubber Co., Providence, Rhode Island.]

GAME WITH RUBBER BALL.

In the game called "Shinny in the Box," here illustrated, a solid rubber ball 2½ inches in diameter is used. This game is adapted to players of all ages and is said to afford opportunity

for the exercise of skill and endurance, as well as being highly amusing to the onlookers. It can be played by two persons or by teams of two or more on a side. The opposite side of the box is marked out so that rubber quoits may be played, and the complete set consists of box, sticks, rubber balls, quoits and stand. [Wright & Ditson, 344 Washington street, Boston, Massachusetts.]

SHOULDER PAD WITH RUBBER TUBING.

Playing football may not be as perilous as assaulting enemy trenches, yet there are many chances for serious injury. The

football player of to-day has a costume conspicuous for shielding him from such injuries and a new shoulder pad is shown here which has for its effectiveness an air-filled ring of rubber

tubing held in place over the point of the shoulder bone by a lining of leather secured all around both sides of the tubing and padded in the middle. Another rubber tube goes under the arms, and this and the laced collar hold the pad in position. It is claimed that even the severest blows on the shoulders, thus protected, are hardly noticeable. The same idea, a round rubber pneumatic ring, is used in a knee pad with equally good results. [Sell Sporting Goods Co., Canton, Ohio.]

A WHITE-SOLED PAC.

A boot calculated to stand the hardest wear, and give comfort and long service to the outdoor worker is here illustrated. It is

a combination of rubber foot and leather top. The latter is made of a specially prepared waterproof leather, and is provided with a bellows tongue, so that the wearer is assured dry feet, even when standing or walking in deep snow or slush. The upper is of heavy coated duck with ribs to strengthen it. The white sole has a rolled edge, and is made of a special compound which the makers use for their tire treads; (these treads bearing a guarantee of 5,000 miles). The top and upper are joined by four rows of heavy stitching and a loop is formed by a continuation of the backstay. This is an excellent boot for heavy outdoor work in winter. [Converse Rubber Shoe Co., Malden Mass.]

MULFORD APPARATUS FOR APPLYING CARREL-DAKIN SOLUTION.

An apparatus for applying the Carrel-Dakin solution, widely known through its use in the war for irrigating wounds, has lately been perfected by the firm of manufacturing and biological chemists which also makes the solution itself.

A series of individual connecting tubes makes possible the treatment of several wounds at one time from the same reservoir, the special thick-walled rubber tubing with very fine bore permitting only a minimum loss in temperature of the solution as it passes through these connecting tubes. Absolute control of the amount of solution flowing to each individual instillation

tube is maintained by observing through the individual sight drips and regulating by means of metal clamps. The collapsible stand furnished with the outfit has adjustable collars attachable to any size bed post. This apparatus can also be adapted for the "Murphy drip" and for hypodermoclysis. [H. K. Mulford Co., Philadelphia, Pennsylvania.]

THE TRI-CO UNIVERSAL RAIN RUBBER.

Many of the devices for cleaning the windshield of a motor car in a storm are stationary, forming an unsightly attachment in clear weather when their use is not demanded. This simple

little device is designed to be quickly and easily attached and detached from a two-piece shield. It consists primarily of a traveling section which is mounted in and slides along the opening between the upper and lower halves of the windshield, holding on to the edge of the glass by a channel. Two arms project from this section, one to each panel of the shield, and on each arm are two rubber strips set edgewise, so that when moved across the glass sur-

face, water is pressed off by the close fit of rubber to the glass. To prevent possible scratching of the glass, the rivets holding the various parts together are topped with celluloid where there is any chance of contact. This windshield cleaner is made in five models, to fit practically any type of two-piece windshield. [Tri-Continental Corporation, Sidway Building, Buffalo, New York.]

METAL BARREL WITH RUBBER GASKET.

A new type of metal barrel has a 6-inch opening and, also, a special removable head which can be made absolutely liquid-tight by the action of a series of buckles, or bolts, compressing a rubber gasket 3/16-inch round, vulcanized to form a complete circle, hollow at the center. The illustrations are sectional views of the barrel, the upper one showing the

buckle in an inoperative position, preparatory to removal of the head, and the lower showing the buckle in position for making the closure. The further these buckles are turned, the tighter they squeeze the rubber gasket, thus effectively sealing the barrel. The removable head allows this barrel to be used economically for the shipment of powders such as red or white lead, or heavy oils, paints, varnishes and greasy substances difficult to clean out of the ordinary barrel. [Detroit Range Boiler Co., 607-623 Twenty-fourth street, Detroit, Michigan.]

The Editor's Book Table.

THE COTTON YEAR BOOK AND DIARY, 1917, BY S. ECROYD. Marsden & Co., Limited, Manchester, England. [868 pages, 4 by 6 inches, leather-bound. Price, 2s. 6d., net.]

THIS annual, of which the present volume is the twelfth issue, contains in compact compass a vast amount of information regarding the cotton industry in England. A review of the cotton trade for 1916, the exports and imports, the yields of cotton crops all over the world, the profits and losses of English cotton mills, patents, and much statistical information, properly tabulated. A large part of the book is given over to information regarding processes and machinery, every detail of manufacture being explained, with simple illustrations and diagrams. A diary is added, with suggestions as to the week's work in maintaining mill and office efficiency. The book is one which will be found valuable for reference by all manufacturers of cotton fabrics.

THE EFFECT OF WARS AND REVOLUTIONS ON GOVERNMENT Securities, External and Internal. By E. Kerr, Librarian, William Morris Lubrie & Co., Bankers, New York City. [8vo, boards, 131 pages.]

This handsome book for distribution to investors recalls the principal historical events of ten leading modern nations during the last century and presents much information about government indebtedness, wealth, bond issues and their prices in tabular form covering periods of 50 to 100 years. These compilations are unique and add much to the interest and value of the book as a work of reference.

It is pointed out that although wars and revolutions may retard civilization temporarily, they have the immediate effect of stimulating human thought and endeavor, resulting in a period of expansion and invention in the defeated as well as the victorious country.

HOW TO BUILD UP FURNACE EFFICIENCY. A HANDBOOK OF Fuel Economy. By Jos. W. Hays, Chicago, Illinois (16 mo., paper, 154 pages. Price \$1, postpaid.)

With fuel costs abnormally high, this book of practical information by a combustion engineer should find favor with every firm having a steam power plant. Written in a breezy vein, the work will prove entertaining as well as informative, and indicates that all scientific treatises need not be as dry as dust from a literary standpoint. In the words of the author, the book consists of five reels, including a few snorts about industrial efficiency and other things, together with an appendix devoted to oils, gas, wood refuse and other fuels. The five reels tell pointedly and in graphic fashion why and how fuel is wasted, how to spot and stop these wastes, and how to keep them stopped.

STATISTICS OF MANUFACTURES, COMMONWEALTH OF MASSACHUSETTS. Thirtieth Annual Report. Bureau of Statistics, Boston, Massachusetts. [Paper, 8vo, 130 pages.]

With boots and shoes the principal industry of the state, it is not surprising that footwear should lead the rubber industry; and according to this latest source of official information rubber footwear was manufactured to the value of \$27,414,901 by an average of 9,274 wage earners in 8 establishments, representing an invested capital of \$23,184,118. Woven belting and hose to the value of \$1,060,686 were produced by an average of 195 operatives in 6 establishments, representing an invested capital of \$1,172,515. Miscellaneous rubber goods amounted to \$25,805,175, and were the product of an average of 5,078 wage earners in 36 factories, representing an invested capital of \$20,106,498. Each classification showed a big increase over the preceding year, the largest, that of footwear, being \$3,626,113.

THE LAW OF PATENTS FOR DESIGNS. BY WILLIAM L. Symons, LL.M. John Byrne & Co., Washington, D. C. [8vo, 134 pages, buckram binding. Price, \$3.]

This important work treats in a simple and concise manner the practice which obtains in the prosecution of applications for design patents in the United States Patent Office as shown by the rules and decisions. Its six chapters are devoted to Design Patent Statutes; Subject Matter for Design Patent; Invention; Novelty and Infringement; Applications and Letters Patent; Procedure in the Patent Office. Design patents are of great interest to lawyers, manufacturers and others dealing with industrial development, and this is the only text book on the subject published since 1889. The history of the design patent law; its development, and the present law are fully discussed. The author is a member of the bar of the District of Columbia, a lecturer at the Washington College of Law, and an examiner at the United States Patent Office. It is not surprising, therefore, that his book has been cited as an authority in briefs filed in the Supreme Court of the United States as well as in many federal courts, and that it has been quoted in decisions rendered by the Patent Office. Since its publication in 1914, two supplements have been issued reviewing all decisions and Patent Office rules published on this subject up to October 1, 1916.

PENANG CHAMBER OF COMMERCE. REPORT FOR THE YEAR 1916. [Cardboard cover, 122 pages, tables.]

In spite of shipping difficulties, those countries in a position to supply material needed in the great European conflict are prospering in no inconsiderable measure and Penang, a tin and rubber exporting center, is no exception. The volume of trade during the year 1916 shows a marked increase over that for 1915; money is plentiful, bankruptcies few and generally unimportant. The new Bangkok-Penang-Kuala Lumpur line by which railroad communication is established between Siam and the Malay Peninsula—also plans for developing the part of Prai—are further indications of a growth which owes not a little to the impetus of the war. The question of alienation of land to foreigners naturally finds a place in the report, and it is gratifying to note that although the vast majority of producers in Malaya are badly infected by the American scare, there are a few—but a very few, let it be said—who have remained immune and are able to look at the matter with impartiality.

STATISTICAL ABSTRACT OF THE UNITED STATES, 1916. Thirty-ninth Number. Department of Commerce. Government Printing Office, Washington, D. C. [Paper, 8vo, 773 pages. Price, 50 cents.]

This annual publication of the Bureau of Foreign and Domestic Commerce contains the official statistics of the United States relating to area, natural resources, population, etc.; education, agriculture, forestry and fisheries; manufactures and mines; occupations, labor and wages; internal communication and transportation; merchant marine and shipping; foreign commerce; commerce of non-contiguous territory; consumption estimates; prices; money, banking and insurance; public finance and national wealth; army, navy, civil service, pensions, etc.; statistical record of the progress of the United States; commercial, financial and monetary statistics of the principal countries of the world.

According to the summary of manufactures for the census year 1914, 49 establishments manufacturing woven and rubber hose, representing a capital of \$27,285,000 and employing 7,394 persons, turned out a product valued at \$28,002,000. Rubber boots and shoes to the value of \$53,822,000 were manufactured by 23 establishments, representing a capital of \$46,051,000 and employing 20,359 persons. Miscellaneous rubber goods amounting to \$223,611,000 were the product of 301 establishments, representing a capital of \$199,183,000 and employing 62,257 persons.

A table of crude rubber imports from the time of the Civil War up to the present shows an almost constant gain from 2,125,561 pounds in 1862 to 267,775,557 in 1916, an increase of over 127 times. The table of average import prices of india rubber and gutta percha* crude per pound from 1892 to 1916 is also of interest. It gives the price in 1892 as 49.3 cents, and in 1916 as 57.9 cents, but shows the price of 42.9 cents in 1893 to be the lowest and of 105.8 cents in 1911 to be the highest during the period.

Exports of domestic manufactures of india rubber of all sorts have increased from \$6,543,735 in 1906 to \$35,153,374 in 1916. Exports of foreign unmanufactured india rubber, gutta percha and substitutes, however, have fallen off from \$5,063,065 in 1912 to \$2,929,405 in 1916, although exports of foreign manufactures of india rubber and gutta percha have increased from \$6,746 in 1912 to \$39,186 in 1916.

DE GOUVERNEMENTS - RUBBERONDERNEMING "SLOOTWIJK."
Rapport van den Directeur van het Caoutchoucbedrijf bij het Bosch-
wezen in Nederlandsch-Indië, met verlet in Nederland, H. J. van Has-
selt, ingevolge opdracht van Zene Excellentie den Minister van Koloniën
by besluit van 25 October 1915, Afd. A3 en B., No. 34. [Paper cover,
104 pages.]

"The government is the body least fit to cultivate a doubtful crop." With this drastic quotation the author commences the history, present condition and future prospects of the government's rubber plantation, "Slootwijk," in Surinam, and the statement is fully borne out by the story of failure that follows—failure due to ignorance of the most essential points in rubber cultivation, to grave mistakes in management and administration. A comparison of the estate as it is after past errors have been retrieved as far as possible, with government estates in the East, as well as investigation into the condition of other crops in Surinam, lead the author to conclude that *Hevea* planting in the latter country does not pay and should absolutely not be encouraged.

NEW TRADE PUBLICATIONS.

MUCH favorable comment has been elicited by the striking advertising design entitled "Fisk Tires at the Beginning," which appeared on billboards throughout the country during the month of June. The work of N. C. Wyeth, an American artist of international fame, this poster depicted stalwart negroes coming out of South American forests laden with huge baskets of crude rubber.

* * *

"Bowohoco News" is the name of a very readable four-page paper published monthly in the interests of the employes of the Boston Woven Hose & Rubber Co., Cambridge, Massachusetts. In addition to the personals of this thriving factory, inspiring statements regarding the progress of the business are made and much valuable information to all engaged in rubber manufacture is reported. The staff consists of William F. Wall, editor; John B. Kelley and Grant L. Wiswell, associate editors.

* * *

The Link-Belt Co., Chicago, Illinois, is sending out a strikingly effective booklet entitled "The Ideal Drive for Textile Machinery." The silent chain drive made by this concern is fully explained, and a large number of half-tones illustrate the use of these drives in textile mills. The cover and the borders of the pages so thoroughly imitate woolen goods as to surprise those who receive the booklet.

* * *

Advice is made up principally of don'ts and do's, and the don'ts predominate. The Goodyear Tire & Rubber Co., Akron, Ohio, has issued a set of bulletins for tire users. Each is a little leaflet, about envelope size, devoted to one particular phase of tire service. The list comprises "How to Increase Tire Mile-

*India rubber only after 1890.

age," "Proper Inflation Pays," "What to do for Tread Cuts," "Fabric Breaks," "How to Avoid Scraped Treads," "Premature Tread Wear," "How to Use Chains," "How to Make Inner Tubes Last Longer," "Rim Cutting," "Chafed Side-Walls" and "The Way to Maximum Mileage."

* * *

The Batavia Rubber Co., Batavia, New York, has issued a neat little advertising souvenir representing a wire wheel, to which is fitted a miniature tire of real rubber, bearing the ribbed tread used by this company. The whole affair is only a little more than two inches in diameter, and while it may not have been intended to be used as an eraser, it has proven efficacious in this particular.

FAULTLESS "WEAREVER" ADVERTISING ON BROADWAY.

The Faultless Rubber Co., Ashland, Ohio, manufacturer of "Wearever" rubber goods, has been chosen as representative in the household rubber goods field of the high ideals for which the Rice Leaders of the World Association stands.

As an association member the Faultless company will flash its messages to the public every night on the mammoth electric sign erected on the roof of the Hermitage Hotel, New York City. This elaborate sign occupies one thousand square feet of space, and the display, illuminated with thousands of brilliantly colored electric lamps, makes a most beautiful picture which attracts the attention

of over 70,000 persons who pass through this great thoroughfare nightly—not only New Yorkers, but thousands of visitors to the great metropolis.

THOSE WISHING TO KEEP INTIMATELY POSTED ON ALL SUBJECTS pertaining to American preparedness and participation in the war will find the pages of "National Defense and the International Digest" intensely interesting. This attractive monthly magazine is published by the Writers' Press Association, 304 Madison avenue, New York City, at \$1 a year; foreign subscription, \$1.50. It contains many well-illustrated articles by prominent army and navy officers, eminent engineers and manufacturers, and leading publicists on timely topics of national and international importance.

A VIVID WORD PICTURE OF AKRON, OHIO, "THE RUBBER CITY," as it was, is and will probably become, detailing the phenomenal expansion of its titanic industries, depicting its present social and living conditions, and outlining the gigantic civic problem confronting its leading men, is entitled "Akron: Standing Room Only!" by Edward Mott Woolley, the leading article in "McClure's Magazine" for July. Seldom has fiction proved more fascinating than the authenticated facts there presented.

Interesting Letters from Our Readers.

MANUFACTURERS SOUGHT FOR WEBBED GLOVE.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—Enclosed you will find photograph of the very first webbed glove that I made. The webs are solid piece with the rest of the glove. I made it on a plaster paris mold of my own design.

I would like to find someone to take up manufacturing on a large scale, as I already have large orders from the biggest dry goods houses in the country to bring them in to put on sale. Or I would make liberal arrangements to manufacturers on a royalty basis for the whole United States.

My patent is one of the best and my mold is registered also. I have the whole market of the world before me.

A. K. ZAWODZSKI.

2405 E. Allegheny avenue, Philadelphia, Pennsylvania, July 22, 1917.

RUBBER CARGOES AND THE SUBMARINE.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—Brazilian rubber and other cargoes destined to the United States now enjoy the protection of an American squadron which arrived in Rio de Janeiro early in June to relieve the British and French patrol of the western hemisphere and was accorded a hearty welcome by the Brazilian Government, the Chamber of Deputies cabling a message of congratulations to the Congress of the United States. This act, together with the seizure of 46 interned German ships following revocation of neutrality by Brazil, seems to foreshadow her active co-operation with the United States in the war.

Already the American navy is making itself felt in the submarine zone where U-boat work is materially weakening. The arrival of our destroyer flotilla and of allied cruisers released from American waters has provided more ships, while progress in the prosecution of the anti-submarine campaign and more vigorous offensive measures have greatly reduced the list of sinkings for several weeks past. Naval experts believe the improvement is cumulative, and that another "black week" will not occur. Gun crews of merchant ships are also doing good service in beating off attacks, and have bagged one or more U-boats, while the steamship "Mongolia," which fired the first gun and made the first hit for America in the war, has again come into the limelight, having exchanged four shots with a German submarine that fired a torpedo at her on her last passage to London. Neither the liner nor the submarine was hit.

Shortage of ships and consequent high cargo rates have

materially increased the cost of production of rubber goods, but have by no means become the serious matter that they might. With the government shipbuilding program well under way, no serious interruption of the crude rubber supply seems likely, but should unrestricted submarine warfare really threaten the American rubber industry leading men in the business may well jointly turn to Simon Lake for relief. It was he who invented the submarine and he, if anybody, who can defeat it. The world no longer laughs at Simon Lake, for he has made good all his statements and all his prophecies have come true. His statement that the German submarine can be beaten at its own game of invisibility by submersible cargo boats appeals to every thinking man as a last resort that cannot fail, but Lake goes a step farther and points out certain advantages held by this type of ship in peace times, thus indicating that the construction of such vessels may properly be regarded as better than an emergency investment. The "Deutschland" proved that subsea commerce is absolutely practicable, but whereas she carried only about 500 tons of merchandise, the huge undersea cargo boats Lake stands ready to build according to his latest standardized plans are of 5,000, 7,500 and 10,000 tons dead weight carrying capacity, designed not for speed but for safety in operation and utilizing almost any kind of propelling power most readily obtainable. Germany is reported to have been planning a fleet of such submersible merchantmen when the United States entered the war and our ports were closed to German ships. Now the opportunity is ours or that of our allies. Narrowing the matter down to crude rubber imports, England could perhaps profit more by such ships than America, because at present most of our rubber reaches us direct from the Far East and absolutely unmolested. On the other hand, Germany figures that she can accomplish most by confining her attacks to the congested sea lanes of the English channel where the maximum of ships may be sunk with the minimum of effort and time. As a happy sequel to the death and destruction wrought by the war submarine it would be a satisfaction indeed to have this wonderful invention rehabilitated for constructive service in peaceful merchant shipping.

ONLOOKER.

Boston, June 28, 1917.

AIR SUPPLY DEVICE FOR RUBBER BOOTS.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—I cannot see why rubber companies do not manufacture something in the way of a pneumatic insole to keep the feet dry when wearing rubber boots. I made a pair over 30 years ago and still have this first crude affair. The insole was provided with a flat rubber bulb at the heel. From the

back of this bulb a tube passed up beside the ankle to the top of the boot. From the front of the bulb there was a flexible tube within the insole to a point near the toe. The operation of the sole was this: As the weight was thrown on the heel (in the advance step), the heel acted as an automatic valve and closed the back tube, at the same time forcing fresh air out of the front tubing at the toe. As the perpendicular line of bearing was carried forward, and the weight came upon the ball of the foot, the front tubing was closed. The pressure on

the bulb then being released, it at once took a fresh supply of

air from the top of the boot, and so on alternately at every step, thereby keeping the feet sweet, clean and dry.

All who have worn rubber boots, especially in warm weather, know the torture they undergo and I would like to see such a thing put on the market at a reasonable price.

M. C. BARDEN.

West Pawlet, Vermont, June 4, 1917.

As far back as 1890 the Hannaford ventilated boot, manufactured in Boston, was on the market. It had an elastic middle sole with compressible air cells connected with a tube extending to the top of the leg. It was similar in action to Mr. Barden's device, though the pneumatic feature was an integral part of the boot. We understand Mr. Barden's idea is a separate insole which can be placed in any of the boots now manufactured. Some years ago the Commonwealth Shoe & Leather Co., of Boston, Massachusetts, bought out the "Resilia" shoe, which had a ribbed rubber inner-sole effecting the same purpose, the air intake being at the breast of the heel. Its manufacture was discontinued after it had been on the market a few years. Undoubtedly any effective method of ventilating rubber boots must conduce to the comfort of the wearer.—THE EDITOR.

PFYFFER'S RESILIENT WHEEL WITH PNEUMATIC HUB.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—Your good description of my resilient wheel in the June issue, page 523, leads me to supplement additional information regarding its operation, which is based upon a new and thus far not generally admitted principle.

As it was your book "Rubber Tires and All About Them," which, more than anything else, showed me the right trail, especially by way of what you said on page 30 about the way in which a pool of water "receives a solid body thrown into it," I should like first of all to thank you for this book and then to take the liberty of submitting the main principle upon which my invention is based, to your kind personal investigation.

The whole question is whether or not from a given pneumatic tire, with a given inflation pressure and a given load, or load-shock, there is a bigger depression obtainable when the tire is in contact with a convex-shaped rigid member encircling the tire, than when the tire is in direct contact with the flat road.

My convex-shaped member *D* takes, so to say, the place of the pebble on the road in relation to the pneumatic tire, or the place of the "solid body" of your book (page 30) thrown in a pool of water. Not being able to increase the pool of water, I practically reduced the size of the solid body by reducing the size of the bearing part of the member *D*.

All the many attempts made long ago to obtain a really puncture-proof pneumatically cushioned wheel by putting an inflated tire somewhere between rim and axle instead of between rim and road proved to be a failure because no satisfactory resilience was obtained. The fact was always overlooked that the position of the tire inside of the rim necessarily means an enormous increase of the bearing surface, the encircling rigid member always bearing upon one-half of the circumference of the tire (in length). Now by means of the convex shape of the encircling rim I reduce at will the width of the bearing surface, thereby counterbalancing the increase in length. The result, as proved by my working model, is a lively cushioning effect not hitherto obtained from a pneumatic tire placed inside of the rim.

Repeated tests with my working model have confirmed the following facts:

1. A considerably deeper depression is obtained in contact with the convex-shaped member than the depression obtainable in direct contact with the flat road.

2. All other factors being the same, the depression is increased in proportion to the reduction of the radius of the rigid member's convexity.

3. A stronger inflation is allowed when the tire is bearing upon the convex-shaped rim without the increased inflation

pressure, giving such hard riding as would result from the same inflation in direct contact with the flat road.

4. Given a certain depression of the axle, a much gentler bend of the tire is obtained in contact with the convex-shaped encircling rim than the bend obtained in contact with a flat body, and this is the case in the plane parallel to the wheel as well as in the plane rectangular to the wheel.

5. The road shocks operate in my resilient wheel in an entirely different way according to their nature; those which are strong and persistent enough to overcome the inertia of the whole rim-section of the wheel being transmitted to and absorbed by the internal pneumatic tire, while quicker or weaker shocks are absorbed by the rim parts (solid rubber or other material) in contact with the road, eventually spoiling them to a certain extent. Thus practically all shocks are prevented in one way or the other from reaching the axle.

These five facts are of far-reaching importance, opening up an entirely new field for the use of pneumatic tires in well protected and well supported position somewhere between rim and axle, be it in addition to the usual pneumatic tire in contact with the road, when softest resiliency is wanted (*twice* pneumatically cushioned ambulance cars) or in combination with solid tires or even bare steel rims in contact with the road for commercial and war vehicles, where unflinching reliance and low maintenance cost under rough conditions is required. Power losses such as Professor E. M. Lockwood referred to in THE INDIA RUBBER WORLD of May, 1917, page 447, as being due to "flexure at the contact with the road" and to "under-inflation," are reduced to the minimum.

DR. P. DE PFYFFER.

New York City, June 5, 1917.

THE OBITUARY RECORD. AN OLD-TIME RUBBER MAN.

HUGH A. NEWELL, for many years connected with prominent rubber companies in the capacity of superintendent, died at his home in Reading, Massachusetts, on July 10, aged 72 years.

HUGH A. NEWELL.

He was born in Belfast, Ireland, and came to America when about 22 years old. His first position was with the Revere Rubber Co., Chelsea, Massachusetts, in its coated fabric department, where he worked for three years, going from there to the Aetna Rubber Mills, which were owned by Clapp, Evans & Co., at Jamaica Plain, Massachusetts, where rubber boots, clothing and general molded goods were made. Here he advanced to foreman under the superintendence of Wheeler Cable. After 12 years with the Aetna company, in 1881, the Cable Rubber Co. was formed for the manufacture of high-grade rubber clothing and carriage cloth, and Mr. Newell became its superintendent. After nine years with this concern he went to the Reading Rubber Manufacturing Co., Reading, Massachusetts, filling the position of superintendent of that company for 22½ years. His next position was with the International Rubber Co., West Barrington, Rhode Island, then a small concern with a single calender, and which during his five years' connection grew to treble its former capacity. He retired from active business a few years ago and returned to Reading, where he had spent so many of his active years. At his death he was a member of the Baptist Church of that town.

Mr. Newell was well known in the trade as an able and efficient

official for the different concerns with which he was connected. He is survived by two sons, James, now with the Reading Rubber Manufacturing Co., and Harry K., who was formerly with the International Rubber Co., and two daughters, his wife having died seven years ago.

A RAINCOAT MANUFACTURER.

William O. Anderson, president of the L. M. Anderson Co., manufacturer of rainproof garments, Trenton, New Jersey, was drowned in the Delaware and Raritan Canal, which is near the factory of the company, July 7. It is thought that his mind became temporarily unbalanced, as he brooded over the automobile accident of a day or two previous, for which he might have considered himself responsible, and in which three persons were severely injured. The deceased was at the head of the above named company, and was active in its management. He was 60 years of age at the time of his death. He leaves a widow, and one son, A. J. Anderson, who is vice-president of the same manufacturing company.

A POPULAR SALESMAN AND EFFICIENT MANAGER.

John P. Stockton, president of The Globe-Gibraltar Rubber Co., Cleveland, Ohio, died July 19 at St. Luke's Hospital in that city, as the result of an automobile accident six days previous. Mr. Stockton was about 36 years of age, and was a very successful tire salesman. He had a large acquaintance in the trade and gained many friends wherever he traveled. It was through his genial disposition that he made a success of the Armstrong Rubber Co., which is now the Globe-Gibraltar company. He was a lineal descendant of Richard Stockton, a signer of the Declaration of Independence, and of Commodore Stockton, U. S. N. He leaves a widow and two children.

OFFICIAL OF AN AKRON ESTABLISHMENT.

A. L. Neiswanger, vice-president of the India Rubber Co., Akron, Ohio, was fatally injured in a street car collision in that city, July 3. He was born and reared in Orrville, Ohio, 40 years ago. He is survived by a widow, two brothers and a sister.

TRADE-MARK DECISIONS.

A. A. WATERMAN & CO., v. L. E. WATERMAN COMPANY. A history of the litigation regarding the use of the name "Waterman" by makers of fountain pens would fill several columns. The latest decisions include that in a suit in the New York Supreme Court, and in an appeal in the Appellate Division of the court. The former was instituted by Isaac E. and William L. Chipman, doing business as A. A. Waterman & Co., to restrict the L. E. Waterman Co. from interfering with their rights in the use of the words "A. A. Waterman & Company" and from bringing any suit for damages or injunction against any person by reason of the manufacture or sale by such person of any fountain pen bearing these words. The Court ruled in favor of the plaintiffs, provided, however that the words "Not connected with the L. E. Waterman Company" were added to the words "A. A. Waterman & Company." An appeal was taken by the L. E. Waterman Co. and the Appellate Division of the Court reversed the above ruling. [Trade-Mark Bulletin, May 1, 1917.]

EX PARTE, THE MILLER RUBBER CO. The goods sought to be covered by one registry include virtually everything made of rubber as, for example, vehicle tires, bathing caps, rubber heels, rubber tubing, barber's bibs, balloons and rubber sponges among others. Obviously these could not all be included in any existing class of goods; the applicant's virtual proposition is that a new class of goods could be formed to include everything made of rubber and it points out certain undoubted hardships

in having to make several registrations at heavy expense. The convenience of the applicant cannot be paramount to the convenience of the public. The applicant does not make rubber, but various articles of rubber. If the applicant wishes to use the same mark on tires and on bathing caps, it must make separate registration; there is no possible way to avoid it. [Trade-Mark Bulletin, June 1, 1917.]

STORK CO. VS. STERLING CO. The defendant company applied for registration for maternity frocks, a design representing two storks holding a banner bearing the words "La Mere." The plaintiff filed an opposition as owner of a trade-mark of the same description except with the name "Stork" in place of "La Mere," for waterproof fabrics and articles made therefrom. [Trade-Mark Bulletin, May 1, 1917.]

EX PARTE L. CANDEE & CO. The trade-mark "Unika" was refused registration on the ground that it is similar to the previously registered "Unico" trade-mark for boots and shoes. This latter trade-mark, however, was registered for leather boots and shoes, and the decision is that reference be withdrawn and trade-mark allowed. [Trade-Mark Bulletin, May 1, 1917.]

BOSTON RUBBER SHOE CO. V. ABRAMOWITZ. An interference proceeding where application was made to register the words "The Hub" with a picture of a hub between them for leather shoes. Another applied for registration of the word "Hub" as a trade-mark for shoes with canvas uppers and leather or rubber soles. The latter could show no proof of use except on tennis shoes with leather insoles and on rubber shoes. Hence the commissioner decided there could be no interference. [Trade-Mark Bulletin, May 1, 1917.]

EX PARTE, INDIA RUBBER, GUTTA PERCHA & TELEGRAPH WORKS, LIMITED. The trade-mark "Silver King" for golf balls was rejected because of prior registration of the trade-mark "King" for the same goods. The commissioner held there was no likelihood of confusion, as the word "Silver" is the most prominent part of the proposed trade-mark and it has a suggestiveness different from the word "King." [Trade-Mark Bulletin, June 1, 1917.]

THE GOODYEAR TIRE & RUBBER CO. V. THE FIRESTONE TIRE & RUBBER CO. The Firestone company filed on November 4, 1915, an application for registration of a trade-mark for rubber tires and casings for vehicles, originally said to consist in a black tread and red side walls, but later defined as a circumferential band of black intermediate between two circumferential bands of red, disclaiming the picture of the tire itself. The application was rejected on reference to registration No. 85,434 to the Goodyear company, dated February 20, 1912, of a central circumferential band or stripe of blue; but on argument that rejection was withdrawn. Upon allowance and publication an opposition was filed by the Goodyear company and sustained, from which ruling appeal is taken by the Firestone company.

Assistant Commissioner Clay in his argument sustaining the decision of the Examiner of Trade-Marks, concludes^{as} follows:

"Broadly considered, I think the applicant's mark fails to come within the proper definition of a trade-mark, and especially it is not a 'mark by which the goods of the owner of the mark may be distinguished' in the sense of the Trade-Mark Act." [Decisions of the Commissioner of Patents, May 22, 1917.]

CUSTOM HOUSE DECISION.

CRUDE CHICLE. The Board of General Appraisers sustained the protest of Schutte, Bunemann & Co., New York City, regarding the assessment of duty of 20 cents per pound as refined chicle. Claim was entered that it was crude chicle and dutiable at 15 cents per pound, in accordance with another provision of the same paragraph of the tariff act. On the authority of Abstract 39,077 the chicle in question was held dutiable at 15 cents per pound, under paragraph 36 of tariff act of 1913.

S. A. E. SUMMER MEETING.

The summer meeting of the Society of Automotive Engineers, held June 25 and 26 at the Bureau of Standards, Washington, D. C., with headquarters at the New Willard Hotel, was an important one devoted almost exclusively to war needs. Monday was devoted to the standards committee, several divisions of which, including those devoted to aeronautics, electrical equipment, lighting and starting batteries, reported. Tuesday's program included the business and professional session, with reports of officers and miscellaneous business, discussion of the reports of the standards committee, and the reading of the following papers:

Building Submarine Chasers by Standardized Methods, by Henry R. Sutphen. (Illustrated by motion pictures.)

The Farm Tractor as Related to the Food Problem, by H. L. Horning. (Illustrated by motion pictures.)

Design and production of Aircraft in War Time, by Wing Commander I. W. Seddon, of the British Commission.

Classes and Uses of Battleplanes, by Lieut. Amaury de la Grange, of the French Commission.

Fundamentals of a Successful Kerosene-Burning Tractor Engine, by C. E. Sargent.

LESSONS OF THE WAR IN TRUCK DESIGN.

The paper "Lessons of the War in Truck Design," by W. O. Thomas, was particularly pertinent at this time and offered many valuable suggestions based on actual war experience, among which those relating to tires are of interest. He said:

All trucks sent from Canada were fitted with demountable tires on standard S. A. E. rims. This was decided upon before the British had adopted the American pressed-on type with a view to easy replacement in the field. Two makes were used in approximately even quantities. On both makes the locking rings and bolts and nuts were thoroughly vulcanized. Most of the tires were carefully shipped fitted with wooden center struts to prevent distortion of the rims. Ample spare tire parts of all kinds were supplied.

The subsequent use of these tires on the muddy roads in Flanders showed that they were much more difficult of replacement than the pressed-on type which is now standard on all British trucks. After the tires had been in use for some time in the mud they were removed only with the greatest difficulty, and once the rims had become rusted it was often impossible to remove them, even in a tire press. The most effective way was to take out the remnants of the rubber and to jar and expand the rims with a sledge hammer.

The tires of the pressed-on type, on the contrary, were easily applied and removed in a tire press, which was always to be found at every tire store. Tire presses also were fitted on railway cars, which were always available at railhead points with a stock of tires. As the main function of the motor trucks was to ship material and supplies from these same railhead points this method of replacement was a very simple matter.

Spare wheels with tires applied were always available at more advanced points, but these were necessary in any case to guard against the breakage of wheels and were easily used if there should be an emergency case of tire trouble in the field. Tires were almost universally pressed on with burlap strips. This was at first criticised, but it did not appear to cause any trouble, as with the general muddy condition it probably aided in the quick rusting on of the tire.

The standardization of the pressed-on type of tire on S. A. E. rims cannot be too strongly recommended. I am satisfied that the demountable type will be found wanting in war service in France.

ADVANTAGE OF SINGLE TIRES.

It is advisable to limit the number of sizes of tires to as few as possible. It is possible to use 5-inch for front wheels of all trucks, because the smaller trucks are naturally faster moving and the additional speed will easily make the wear even. In France a great many of the trucks are used with 5-inch dual tires on rear wheels. These developed serious troubles on account of the load often being concentrated on one of the tires only. On the granite block roads a projecting block on a damaged road would often cut out a large section of one of the tires. On heavily cambered roads the weights would concentrate on the inside tires. I am convinced that the wider-section single tires on rear wheels suffered less damage from these causes than the dual tires. I believe that tires with a slightly convex tread give

better service than absolutely flat-tread tires. Many of the tires sent from America to France appeared to be over-cured. In general they were harder and more liable to crumble than the European tires. On the other hand, many of more resilient tires gave trouble near the base and became detached from the steel ring.

TIRE AND RIM RECOMMENDATIONS APPROVED.

The carrying capacities and inflation pressures of pneumatic tires recommended by the Tire and Rim Division, as published on page 579 of our July issue, were approved by the Society.

THE JOURNAL OF THE S. A. E.

"The S. A. E. Bulletin," published for several years past, has been discontinued and replaced by "The Journal of the Society of Automotive Engineers," printed in the standard technical size, 9 by 12 inches, and is a credit to the organization.

MOTOR-CYCLE STANDARDIZATION UNDER WAY.

Another division was added to the standards committee of the S. A. E. when, at the request of the Ordnance Department, the members of the Motorcycle and Allied Trades Association joined the S. A. E. to carry its standardization work into the motor-cycle industry.

Motor-cycles for dispatch riders, transporting machine guns on side cars, and many other purposes are playing a conspicuous part in the war, and the need for standardization of detail dimensions of parts has constantly been becoming more obvious. A study is now in progress looking toward the formulation of a standard set of specifications to be used in the purchase of military motor-cycles. Typical machines are being examined and sub-committees have been appointed to report on the parts that can be standardized.

At a meeting of the temporary motor-cycle division of the standards committee on June 28 it was decided to standardize tires, rims, spokes, headlamp mountings and supports, chains, throttle control, clutch and brake pedals. Other items may be standardized at an early date. It was decided that both the front and rear wheels of the motor-cycle and the wheels of the side and rear car are to be alike and to carry the same rims and size and type of tire. Tire and rim specifications follow:

TIRES. All tires of military motor-cycles, side cars and rear cars are to be of the clincher type, 28 by 3 inches in dimension.

RIMS. All rims for military motor-cycles are to be made for 28 by 3 inch clincher tires and have the standard cc., with forty spoke holes, 17/64 inch in diameter, suitable for 1/4 inch spokes.

AMERICAN CHEMICAL SOCIETY.

THE program of the meeting of the American Chemical Society, to be held at Massachusetts Institute of Technology, Boston, Massachusetts, September 10 to 13, will include a general conference on "Chemistry in Warfare," opened by William H. Nichols, chairman Committee on Chemicals, Council of National Defense, and Marston J. Bogert, chairman Chemistry Committee National Research Council.

At the divisional meetings there will be conferences on "The Supply of Organic Chemicals for Research During the War" and "The Industrial Chemist in War Time."

The special committee appointed to lay definite recommendations before the Federal authorities that chemists be used for chemical service during the war, finds that the government has decided against any general class exemption. It is therefore recommended that chemists who may be drafted present facts of their education, experience and employment to local boards, with the request that they be allowed to continue at their present work, or in default of this, be detailed to serve as chemists in the military branch of the government.

The purpose of this recommendation is to put into the possession of the government authorities all the facts necessary for it to decide exactly for what service a given man is most fitted.

News of the American Rubber Trade.

FISK BUYS THE GIBNEY TIRE.

ON July 9 the United States District Court of Philadelphia, Pennsylvania, authorized the receiver, Henry C. Thompson, Jr., to consummate the offer of The Fisk Rubber Co., Chicopee Falls, Massachusetts, for the plant and all the assets of the Gibney Tire & Rubber Co., Conshohocken, Pennsylvania. The purchase price is about \$410,000, subject to such adjustments as may occur by reason of the closing of the books on July 9.

The Gibney solid tire has a reputation and trade name of considerable value, but the company lacked adequate capital in an enterprise requiring large amounts of money, and unwise purchases of crude rubber during a war-brought rubber trade flurry had further weakened its financial standing. In purchasing this property, the Fisk company assures the financial stability of the business and acquires a trade name and volume of production that will prove of distinct advantage in developing the sale of its own solid tires. Henceforth the Gibney tires will be manufactured on a much larger scale than in the past, a triple or even quadruple production being promised to consumers and the trade. The big Fisk solid tire unit at Chicopee Falls, Massachusetts, will also be put into operation as soon as possible. It is designed to have an output of 2,000 tires a day, making it one of the largest solid tire departments in the country.

Fortunately, the Gibney service stations in a number of cities, including New York City and Philadelphia, Pennsylvania, do not conflict with the Fisk branch system, and they will be retained practically intact, as will the Gibney organization, except that James G. and John Gibney have resigned. The increased output, however, will be marketed not only by the Gibney system, but by the more than 125 sales branches of the Fisk company, thus placing the latter in a stronger position as a distributor of solid tires.

CARLISLE WANTS A RUBBER FACTORY.

According to the Chamber of Commerce of Carlisle, Pennsylvania, a careful investigation by experts employed by that body results in a report that Carlisle is one of the best places in the country in which to locate a rubber factory, because of its location and railroad connections, its very dry atmosphere and its excellent water supply. Following this report, the Chamber of Commerce is endeavoring to induce some live, active rubber concern to locate there, and is ready to offer free factory site, low cost electric power, and financial assistance if necessary, to such a concern. Moreover, it is stated that there are many men living in Carlisle who are skilled in rubber working, having been employed at one time or another in rubber factories.

RUBBER COMPANY SHARE QUOTATIONS.

The following market quotations of shares of rubber manufacturing companies on July 25 are furnished by John Burnham & Co., 115 Broadway, New York City, and 41 South La Salle street, Chicago, Illinois.

	Bid.	Asked.
Ajax Rubber Co. (new).....	66½	7½
Firestone Tire & Rubber Co., common.....	118	21
Firestone Tire & Rubber Co., preferred.....	103	6
The B. F. Goodrich Co., common.....	49	50

United States Rubber Co., common.....	60¾	60½
United States Rubber Co., preferred.....	105	108

SOMERSET RUBBER RECLAIMING WORKS.

One of the busy spots in the rubber industry of New Jersey is the factory of the Somerset Rubber Reclaiming Works at New Brunswick, shown in the accompanying illustration. The plant is running day and night with orders enough for some time to come, many of them for special reclaimed stocks to go into government work for the rubberizing trade. The present capacity

SOMERSET RUBBER RECLAIMING WORKS PLANT

averages about one car of reclaimed rubber a day. New machinery is gradually being added, however, and new buildings are being erected. The laboratory is already one of the most complete of its kind, equipped with machinery of many sorts and supplemented by an analytical department.

Negotiations are in progress for the purchase of properties for the housing of employees, and a new lunch room is in course of construction near the factory to provide restful accommodations where the men can eat their own lunch while a Victrola is being played. Additional shower baths are being installed, which are much appreciated.

OPEN BRANCH OFFICES.

Stresen-Reuter & Hancock, Inc., dealers in colors and chemicals, Chicago, Illinois, have opened offices at 292 Pearl street, New York City, 418 New Market street, Philadelphia, Pennsylvania, and 82 Richmond street, East, Toronto, Canada. Stocks will be carried at these branches, as at the Cleveland, Ohio, branch of this concern.

RUBBER COMPANY DIVIDENDS.

The Boston Belting Co. paid a quarterly dividend of \$2 per share on July 2 to stockholders of record June 21.

The Eagle-Picher Lead Co. paid a quarterly dividend of 1½ per cent on preferred stock on July 16 to stockholders of record July 5.

The board of directors of the United States Rubber Co. has declared a quarterly dividend of 2 per cent on first preferred stock, payable July 31, to stockholders of record July 20.

The Kelly-Springfield Tire Co. has declared a quarterly dividend of \$1 per share on common stock, payable August 1 to stockholders of record July 16.

The Portage Rubber Co. has declared a quarterly dividend of 3 per cent on common stock, payable August 15 to stockholders of record August 5. This dividend raises the stock from a 10 to a 12 per cent basis.

UNITED STATES RUBBER CO. PROMOTIONS.

On July 2 an announcement was sent out by the United States Rubber Co., New York City, stating that W. E. Barker had resigned as manager of sales of the footwear division in order to take up other important duties for the company. The following changes were also announced in the footwear division:

George H. Mayo is appointed manager of sales of this division of the company's activities. Charles W. Barnes becomes general selling agent, and R. F. Spencer is now manager of credits.

Mr. Barker has been connected with the rubber trade during his entire business life, starting with Charles M. Clapp & Co., Boston, Massachusetts, in 1882, and advancing steadily to the position of manager of sales. In 1889 he became selling agent for the Para Rubber Shoe Co., Boston. Three years later he organized the Enterprise Rubber Co., Boston, and for over 20 years was its president. When the office of merchandise manager of branch stores was created by the United States Rubber Co. in 1909 he was the first to fill that position. Four years later Mr. Barker was appointed to the office of manager of sales when that position was made vacant by the death of E. R. Rice. It is from this position that Mr. Barker has just resigned to take up other duties for the company. That he is fully equipped for any service to which he may be called is evidenced by this brief sketch of his experience in the rubber business.

George H. Mayo, who succeeds Mr. Barker as manager, though a younger man, can boast of nearly a quarter century in the

work to do, his immediately previous position being assistant to manager of sales, from which he has just been called to the office of general selling agent of the footwear division.

Richard F. Spencer's business life has always been associated with merchandising. Starting in a general store in 1867, he secured a position nine years later in the wholesale dry goods house of Crow, Hargadine & Co., St. Louis, Missouri. In 1881 he joined the force of Hamilton, Brown & Co., wholesale shoes and rubbers, St. Louis, and in 1888 was elected secretary and treasurer of the Hamilton-Brown Shoe Co., resigning from that position in 1910 to go with the United States Rubber Co. as comptroller, which office was a stepping stone to his new position.

NEW U. S. RUBBER COATED FABRIC FACTORY.

The United States Rubber Co., New York City, has taken over the plant of the Milford Straw Hat Works, at Milford, Connecticut, for the manufacture of coated fabrics, and articles made therefrom. The company has been making a variety of these fabrics, some so closely resembling leather that they are being used extensively for automobile tops and upholstery work. The new factory is now being equipped with mills, spreaders, vulcanizers, etc., and also with machinery and appliances for the manufacture of traveling bags of this new fabric. It is contemplated that the company will also make here army blankets, ponchos and other equipment for the United States Government. The factory has a floor area of nearly 75,000

WILLIAM E. BARKER.

GEO. H. MAYO.

CHARLES W. BARNES.

RICHARD T. SPENCER.

OFFICIALS RECENTLY PROMOTED IN FOOTWEAR DIVISION, UNITED STATES RUBBER CO.

rubber footwear business. Starting at the age of 19 in the wholesale house of Wm. H. Mayo & Co., of which his father was the head, he became a junior partner five years later, just about the time when this firm discontinued its leather footwear business and devoted its entire attention to the sales of the imperfect and out-of-date goods of the United States Rubber Co. He succeeded Mr. Barker as merchandise manager of branch stores in 1913, and following closely, he now succeeds him as manager of sales. His steady, upward climb is the best proof of his fitness for his new position.

Charles W. Barnes has been connected with the United States Rubber Co. interests throughout his entire business life. On his graduation from the English High School of his native city, Boston, in 1885, he entered the employ of the American Rubber Co., then an independent company. When this company became a part of the United States Rubber Co., in 1893, he took an important position in the Boston office, giving special attention to the goods made at the American factory. Ten years later he was called to the New York office, where he has had special

square feet, and there is enough adjacent land to allow expansion. About 400 to 500 hands will be employed, the work to be under the supervision of the Goodyear's Metallic Rubber Shoe Co., Naugatuck, Connecticut. J. Wallace Harney, formerly with the L. Candee & Co., New Haven, Connecticut, is the local superintendent of the new factory.

GLOBE RUBBER TIRE MANUFACTURING CO.

J. B. Linerd, general sales manager of the Globe Rubber Tire Manufacturing Co., New York City, is planning an intensive national sales campaign for its hand-made tires. The plant at Trenton, New Jersey, was originally a part of the United & Globe Rubber Manufacturing Cos. of Trenton, New Jersey, but was purchased in its entirety by the Globe Rubber Tire Manufacturing Co., and since has been entirely independent of and has no connection whatever with the former company. Harry B. James was elected president, Henry L. Joyce, vice-president, and J. P. Hall, secretary and treasurer. The executive offices are at 1851 Broadway.

PACKING PLANTATION RUBBER.

RESPONDING to the activities of the Rubber Association of America, which placed the data and suggestions it had gathered regarding improved packing of plantation rubber at the disposal of the Rubber Growers' Association in London, the latter body has issued a circular to its members drawing particular attention to the following points:

THREE-PLY CASES. It is evident that three-ply cases are the most suitable for carrying rubber, provided they are assembled and closed strictly in accordance with the makers' instructions. Estate managers appear to think that the patent fasteners provided by the makers are not sufficiently strong and that nails must be driven in after the cases are closed in order to ensure safety of the contents. This is wrong and is responsible for serious complaints of bad-outturn, particularly when the rubber has to be opened up for inspection in London and/or New York before being sent on to the manufacturers.

MOMI CASES. Well-seasoned Momi cases, if properly hooped, appear to be satisfactory, but they do not stand transshipment well unless fully $\frac{5}{8}$ -inch thick after being planed ($\frac{3}{4}$ -inch before planing). The importance of using only cases which are sufficiently strong and well put together to ensure safe arrival of the contents does not appear to be sufficiently appreciated, and members are advised to pay whatever additional cost is necessary in order to secure packages that conform to requirements.

CHIPS AND SPLINTERS. All the manufacturers concur in complaining of chips and splinters getting into the rubber. Estate managers realize how important it is to clean the inside of the cases thoroughly before packing, but after the rubber is packed it apparently contracts until there is a certain amount of play inside the case, which results in splinters and particles of wood fraying off during transit and becoming embedded in the rubber. These are very difficult to remove.

It is essential that the rubber should be spread evenly quite close to the sides of the case, which should contain as much rubber as can be packed without undue pressure. A suggestion made by several American manufacturers is that the cases should be lined with cheesecloth or jackinette. The cost is about $\frac{1}{8}$ d. per pound of rubber. This expedition is now under trial.

MARKING. Cases should be clearly marked: "Stow Away from Boilers."

After having been advised by members of the American rubber trade if crude rubber arriving from British possessions shows any improvement in packing and condition on arrival as a result of these suggestions, the Rubber Association of America purposes to communicate again with the Rubber Growers' Association, outlining to them the opinions of American manufacturers and importers in regard to the efforts thus far made to improve methods of packing and shipment.

CRUDE RUBBER RATES ATTACKED.

The Goodyear Tire & Rubber Co., of Akron, Ohio, and others have filed a case with the Interstate Commerce Commission against the Akron, Canton and Youngstown Railroad and others, alleging that the defendants exact second-class rates on less-than-carload shipments of crude rubber from New York City, and the Commission is asked to prescribe for the future the third-class rate on less-than-carload shipments, and fourth-class rate, with a minimum of 36,000 pounds per car, on carload shipments. Similar allegations are made by the Kelly-Springfield Tire Co., Cumberland, Maryland, and the Batavia Rubber Co., Batavia, New York, additional points of destination mentioned being Wooster, Ohio; Buffalo, New York, and Cumberland, Maryland, and in another case the La Crosse Rubber Co., La Crosse, Wisconsin, attacks the classification ratings on crude rubber from New York City and other points in official classification territory to La Crosse. These cases have not yet been assigned for hearings.

PERSONAL MENTION.

Paul Luce, Buffalo, New York, salesman for the Boston Woven Hose & Rubber Co., Cambridge, Massachusetts, and Miss Jennie Campbell, formerly in the office department of the same company, were married July 16 and will reside in Buffalo. Before entering the sales department some years ago, Mr. Luce was foreman of the rubber belt department at the Cambridge factory.

Ralph Starr Butler, professor of advertising and marketing at New York University, has been appointed to the development department of the United States Rubber Co., New York City, to gather and collate data on market conditions. This work was formerly handled by Ralph Nystrom, now with the Hearst forces.

Charles F. Pichon, salesman in the Detroit branch of the United States Rubber Co., has been elected Grand Counselor of the United Commercial Travelers of Indiana. He is the youngest man who has ever gone through the different offices of the Grand Lodge of that state. He has been a traveling salesman for 15 years.

T. W. McNeil, of the Dayton Rubber Manufacturing Co., Dayton, Ohio, has been selected as one of the 12 members of the board of governors for the new Community Country Club.

F. H. D. Kop, manager of the David Birnie Co., rubber, tobacco and coffee exporters of Java, has been visiting this country for the purpose of interesting rubber manufacturers in his product. Mr. Kop states that Java's present output of rubber is 320,000 tons a year. He also says that rubber formerly exported to Rotterdam and London will hereafter be shipped to America through San Francisco.

Arthur W. Stedman, manager of Hagemeyer Trading Co.'s crude rubber department, recently suffered a painful and what might have been a serious injury to his leg while playing golf. His many friends in the trade will be glad to know that he is on the road to recovery and attending to business as usual.

L. A. Duffy, of the Hagemeyer Trading Co., 17 Battery Place, New York City, crude rubber dealer, returned last month from a successful business trip that included Para, Manaos and Ceara.

Robert Allan, manager of the Para branch of the London & Brazilian Bank and well known in the Amazon rubber trade, arrived in New York City last month.

George L. Haenn, of Baltimore, Maryland, has been appointed to represent J. Early Wood, Inc., manufacturer and exporter of chemicals, in that vicinity.

Ralph Croft, crude rubber broker, New York City, has removed his offices from 12 Bridge street to 72 Trinity Place.

Clarence B. Clark, chemist of the Somerset Rubber Reclaiming Works, New Brunswick, New Jersey, was in attendance at the convention of the American Society for Testing Materials held in Atlantic City, New Jersey, during the last week of June at the Hotel Traymore.

Edward Hutchins, for the past six years supervising engineer for the Federal Rubber Manufacturing Co., Milwaukee, Wisconsin, has opened engineering offices in that city at 866 Superior street. He will specialize in the design and construction of rubber manufacturing and power plants, furnishing complete plans and specifications for the buildings and equipment, including machinery layouts for the most economical and systematic handling of the raw materials and the finished products. In experience, Mr. Hutchins is amply qualified, having been connected with Westinghouse, Church, Kerr & Co., engineers, New York City, for 13 years in the construction of various types of manufacturing and power plants and; later, construction engineer in charge of rebuilding the G. & J. Tire Co.'s plant at Indianapolis, Indiana.

TRADE NEWS NOTES.

W. H. Salisbury & Co., Inc., Chicago, Illinois, the oldest leather belting and general mechanical rubber goods house in the Middle West, has moved to more spacious quarters at 308-310 West Madison street.

The Hope Webbing Co. was recently incorporated in Massachusetts to take over the business of the Rhode Island corporation of the same name, having an extensive plant at Pawtucket, Rhode Island, where are manufactured tire tapes, elastic webbing, trunk straps, belting and narrow fabrics. The officers are Joseph B. McIntyre, president; Charles O. Horton, vice-president and general manager; Charles C. Marshall, treasurer; Attmore A. Tucker, secretary. Hayden, Stone & Co., New York City, is handling the 7 per cent cumulative preferred stock of the company.

A three-story brick building, 40 by 85 feet, is being erected by the H. O. Canfield Co., Bridgeport, Connecticut, manufacturer of mechanical rubber goods, to take care of its natural increase in business.

The L. A. Dreyfus Co., manufacturer of rubber specialties, Rosebank, Staten Island, New York, has increased its capital stock from \$100,000 to \$1,000,000.

The Massillon Rubber Co., Massillon, Ohio has increased its capital stock from \$25,000 to \$60,000 and is erecting a two-story brick building, 50 by 50 feet, to care for increased business in surgeon's gloves, druggists' sundries and toy balloons.

The Federal Rubber Co., Cudahy, Wisconsin, is completing a 300-foot ell on a recently erected six-story building in its plant, this addition increasing the capacity of the mechanical goods department about 40 per cent and that of the tire department about 30 per cent. New equipment has been ordered.

The Gillette Rubber Co., Eau Claire, Wisconsin, is installing a 1,000-horsepower boiler plant consisting of the most modern type of water-tube boilers and stokers, including a 175-foot brick stack and a coal-handling apparatus. Edward Hutchins is the construction engineer.

The natatorium at Kitchener, Ontario, built and furnished by President Reider of the Canadian Consolidated Rubber Co., Limited, was officially opened Saturday, July 21. Expert swimmers and divers gave exhibitions during the day and evening.

The Buffalo Foundry & Machine Co., manufacturer of rubber machinery, Buffalo, New York, will build a new pattern shop on Fillmore avenue.

The Warren Rubber Co., Warren, Ohio, has increased its capital stock from \$80,000 to \$100,000, in order to finance a steadily increasing business.

The National Surety Co. recently executed a schedule bond for the United States Rubber Co. for \$5,613,000, which guarantees the honesty of approximately 2,700 of the company's employees both in this country and abroad.

The C. H. Gray Rubber Co., Dallas, Texas, selling agent for Hood tires, has moved its retail store into larger quarters in the Masonic building at Main and Pearl streets, where a thoroughly up-to-date service station is maintained with ten emergency cars at the call of customers day and night. This service and tire changes are absolutely free. The wholesale store of this company is located at 1926 Main street.

The La Crosse Rubber Mills Co., of La Crosse, Wisconsin, recently made a record shipment, 995 cases of rubber shoes weighing 26,000 pounds.

The Gustin-Bacon Manufacturing Co., Kansas City, Missouri, has just completed a fine service station, at a cost of \$50,000, at McGee Road and 27th street, about half way between the residential district and the shopping section. Around this is an L-shaped open garage, which has been most advantageous for the tire service business, better than the old method of having car owners stop along the curbing. The company also maintains a road service, consisting of 11 Ford cars, each of which

carries a stock of tires in assorted sizes, tubes, patches, etc.

An increase of 59 per cent in sales and 61 per cent in earnings for the six months ended June 30, as compared with the corresponding period of 1916, is shown by the Ajax Rubber Co., Inc., New York City. Net earnings were \$1,257,461.

The business of the Indiana Rubber & Insulated Wire Co., Jonesboro, Indiana, has so expanded as to make a radical increase in floor space necessary. This company has always been one of the uniformly successful concerns of the industry.

CAPTAIN APPLETON, SECOND.

FRANCIS H. APPLETON, JR., son of Captain Francis H. Appleton of Boston, is himself a captain, having received his commission from Governor McCall. His command consists of

CAPTAIN FRANCIS H. APPLETON, JR.

71 men all mustered in a part of the 67th of the Massachusetts State Guards. Young Captain Appleton has had considerable military training. He is a member of the Ancient and Honorable Artillery Co. of Boston, acting as Flanker for the commander. In the rubber trade his activities are well known in connection with various committees of the Rubber Association. He is also factory manager and treasurer for F. H. Appleton & Son, reclaimers, Boston and Franklin, Massachusetts. Of the same company William S. Goodwin, first lieutenant, Fred L. Tufts, corporal and three privates are also members of the Appleton force at the Franklin factory, and Lloyd E. Appleton, the secretary of the corporation, is a member of the Home Defense company at Rye, New York.

HAWKEYE COMPANY EXPANDS.

The Hawkeye Tire & Rubber Co., Des Moines, Iowa, has added two Southwark heaters to its equipment, which will enable the company to increase its output to 600 tires a day, its previous quota being about 187 tires and 215 tubes.

It was the intention of this company to do only a local business and supply the various stockholder-dealers throughout the State of Iowa. However, it has been decided by the board of directors to increase the output and enter other territory for the distribution of its tires. Its first outside connection is with the Kiskey Auto Supply Co., of Los Angeles, California.

PROBABLE MERGER OF REPUBLIC AND KNIGHT TIRE INTERESTS.

The controlling interest in the Knight Tire & Rubber Co., Canton, Ohio, has been acquired for the Republic Rubber Co., Youngstown, Ohio. It is understood that the "Knight" and "Blackstone" tires will be continued, and that a portion of the factory, after enlargement, will be devoted to the construction of Republic tires. Probably a new corporation will be formed, with a capital stock of \$20,000,000, to acquire both plants, and make extensive additions and improvements.

NEW INCORPORATIONS.

Allied Rubber & Mica Co., The, January 13 (Ohio), \$25,000. F. E. Driffeld (president and manager); Charles A. Driffeld (vice-president and treasurer); Charles Olds and Mrs. F. E. Driffeld, both directors. Warerooms, store and offices are located at 1430 West Third street, Cleveland, Ohio. To job mechanical rubber goods and electrical insulation, in the states of Ohio, Michigan, New York, West Virginia and Pennsylvania.

Ambrose Braid Co., Inc., July 14 (New York), \$1,000. Henrietta Johnson, 300 E. Fifth street; Joseph Buhl, 1351 Gates avenue, and Chris Dalury, 801 Broadway—all in Brooklyn, New York. To manufacture elastic webs, etc.

Berkshire Rubber Co. of New York, Inc., The, July 9 (New York) \$10,000. Albert Wurts, Pittsfield, Massachusetts, Burkhardt Wurts, 260 Central avenue, and Thomas D. McMurray, 292 Central avenue—both in Albany, New York. To manufacture rubber goods, etc.

Continental Plantation Co., July 16 (Delaware), \$1,000,000. M. L. Gatchell, L. A. Irwin, Harry W. Davis—all of Wilmington, Delaware. Principal office in the State of Delaware is with the Registrar and Transfer Co., 900 Market street, Wilmington, Delaware. To explore for, manufacture and deal in gum, caoutchouc, gutta percha, etc.

Cooper Garage & Vulcanizing Works., Inc., June 26 (New York), \$10,000. A. Stuart Cooper and Florence Cooper—both 95 Spaulding avenue, and Alfred Scrimshaw, 127 Spaulding avenue—all in Buffalo, New York.

Davenport Vulcanizer Manufacturing Co., April 2, (Iowa), \$25,000. Thomas J. Gillaspay and A. D. Brownlie—both of Davenport, Iowa. Principal office, Davenport, Iowa. This company is the patentee and manufacturer of the Davenport Vulcanizer and its supplies, and also manufactures chemically treated strawboard for all makes of vulcanizers; rubber cement; raw rubber patches and semi-cured patches; always-tite cloth; back foolproof patches; the Gillaspay Sure Shot Manifold Heater and its supplies and the Davenport Vulcanizer Kit.

Delion Tire & Rubber Co., June 9 (Delaware), \$3,500,000. John F. Neary, Herbert E. Latter, and Herbert H. Ward, Jr.—all in Wilmington, Delaware. Principal office in the State of Delaware is with the Corporation Trust Co. of America, Du Pont Building, Wilmington, Delaware. To contract for, purchase and deal in all kinds of rubber, automobiles, automobile parts, etc.

Demas Armor-Cased Tire Saving Co., July 2 (Delaware), \$200,000. George H. B. Martin, Philadelphia, Pennsylvania; J. Vernon Pimm and S. C. Seymour—both of Camden, New Jersey. Principal office is with the Corporation Guarantee & Trust Co., Ford Building, Wilmington, Delaware. To manufacture and deal in tires, tire casings and shoes for use on automobiles operated by power.

Dittenhoefer Tube & Rubber Co., July 16 (Delaware), \$1,000,000. Arthur W. Britton, Samuel B. Howard and John A. Moore—all of 65 Cedar street, New York City. Principal office in the State of Delaware is with the United States Corporation Co., 311 S. State street, Wilmington, Delaware. To manufacture and deal in motors, motor parts, tires and tubes of every kind and description.

Double Mileage Tire Co., The, June 19 (Texas), \$5,000. J. N. Bolton, H. H. Rankin and P. H. Spiller—all of Houston, Texas. Principal office, Houston, Texas. To purchase and sell goods necessary in conducting an automobile selling business.

Endurance Tire Sales Co., Inc., June 23 (New York), \$10,000. John Burlinson, 700 W. One Hundred and Seventy-ninth street; Philip R. Straus, 286 W. Seventieth street, and J. Stuart Elkin—all in Englewood, New Jersey. To deal in tires.

Erie Tire & Rubber Co., June 25 (Delaware), \$10,000,000. A. W. Posey, E. G. Adams, H. Bonsall—all of Wilmington, Delaware. Principal office in the State of Delaware is with the American Guaranty and Trust Co., 206 W. Ninth street, Wil-

mington, Delaware. To manufacture and deal in automobile tires and all kinds of rubber goods.

Ganter Tire & Rubber Co., Inc., The, July 9 (New York), \$2,000. William J. Breslin, 850 W. One Hundred and Seventy-ninth street, New York City; Edward J. Ganter and William V. Kiefer—both 251 S. Broadway, Yonkers, New York.

Goodyear Waterproof Co., The, June 22 (New York), \$5,000. Barney Kimmel and Abraham Newman—both of 821 Broadway, and Alexander Weidman, 134 Eldridge street—all in New York City. Rubber apparel, etc.

Gregrea Manufacturing Co., Inc., June 26 (New York), \$100,000. Andrew F. Rea, Toronto, Canada; F. Hammett Gregory, 320 Broadway, and Walter A. Van Ness, 220 Broadway—both in New York City. To manufacture rubber and rubber-like products.

Harvey Tire & Rubber Co., June 30 (Maine), \$1,000,000. The directors are: George S. Soule (president), A. B. Farnham (treasurer), P. B. Drew and T. L. Croteau—all of Portland, Maine. To engage in the manufacture of tires and rubber goods.

International Life Suit Corporation, June 30 (New York), \$3,000,000. Oscar A. Youngren, 11 Broadway; Louis F. Bruen, 330 West End avenue—both in New York City, and James A. Watt, 229 Elm street, Richmond Hill, Long Island. Principal office, New York City. To manufacture rubber life suits.

International Resilient Tire Co., June 18 (Delaware), \$500,000. F. R. Hansell, Philadelphia, Pennsylvania; J. Vernon Pimm and S. C. Seymour—both of Camden, New Jersey. Principal office in the State of Delaware is with the Corporation Guarantee and Trust Co., 927 Market street, Wilmington, Delaware. To manufacture and deal in all kinds of tires, pneumatic airless, wheels and rims for automobiles, etc.

National Rubber Sales Co., July 5 (Indiana), \$25,000. Elmer S. White, David R. Ulmer, Ethel M. White and Blanche A. Ulmer—all of Terre Haute, Indiana. Principal office, Terre Haute, Indiana. To buy, cover, recover and repair automobile, motor-cycle and bicycle tires and to buy and sell auto accessories.

National Synthetic Rubber & Tire Co., July 17 (Delaware), \$1,000,000. Arthur W. Britton, Samuel B. Howard and John A. Moore—all of 65 Cedar street, New York City. Principal office in the State of Delaware is with the United States Corporation Co., Dover, Delaware. To manufacture and deal in all kinds of motors, engines, machines, etc.

Nebraska Tire & Rubber Co. of Omaha, The, July 2 (Nebraska), \$500,000. E. G. Wolfe, G. C. Peironet, C. E. Niswonger, William A. Graham, Irving F. Baxter and G. W. Toman. To manufacture and sell automobile tires, tubes, casings and accessories.

Old Hickory Tire Co., June 26 (Delaware), \$500,000. Charles H. Jones, W. I. N. Lofland, George W. Morgan—all of Dover, Delaware. Principal office in the State of Delaware is with the Capital Trust Co. of Delaware, Dover, Delaware. To manufacture tires, etc.

Pittsburgh Rubber Tire Manufacturing Co., July 9 (Delaware), \$1,000,000. Wilber A. McCoy, Pittsburgh, Pennsylvania; Charles H. Jones, and W. I. N. Lofland—both of Dover, Delaware. Principal office in the State of Delaware is with the Capital Trust Co. of Delaware, Dover, Delaware. To manufacture, buy, sell and deal in automobile tires for automobiles, motor trucks and motor vehicles of any kind and description.

Seneca Rubber Co., Inc., July 18 (New York), \$50,000. Herbert T. Auerbach, 854 Main street; Harold A. Forbes, 241 Maryland street, and Lillian B. Dietz, 40 Laurel street—all in Buffalo, New York. To manufacture rubber products.

S. & S. Rubber Co., Inc., June 30 (New York), \$5,000. William Reidfeld, G. A. Cymburg and Leo Kraus—all of 299 Broadway, New York City. To manufacture rubber products.

Standard Asphalt & Refining Co., June 30 (Delaware), \$5,000,000. James M. Satterfield, L. B. Phillips and J. B. Bailey—all of Dover, Delaware. Principal office in the State of Delaware

is with James M. Satterfield, Esq., Dover, Delaware. To buy, sell and develop all kinds and grades of gas, petroleum, etc.

Tennessee Tire & Supply Co., June 18, (Tennessee) \$10,000. C. W. Parker, A. C. Mahan, Lee M. Ross, W. L. Smith and J. J. Bryant. Principal office, 400 N. Gay street, Knoxville, Tennessee. To handle a general retail business of auto supplies, tires, etc.

Tire Outlet Co., Inc., July 12 (New York), \$1,000. Sydney Bernheim, 35 Nassau street, New York City; Catherine A. Weldon, 591 Seventh street, and Harry H. Jacobson, 55 Grand street—both in Brooklyn, New York. To manufacture tires.

Union Rubber Co., July 7 (New Jersey), \$35,000. Oswald Nitschke, Ashwood avenue, John Hiller, Jr., Twenty-first street; Willima Pettit, Twenty-second street; Frederick Kautz, Twenty-second street—all in Kenilworth, New Jersey. Principal office, Michigan avenue and Boulevard, Kenilworth, New Jersey. To manufacture rubber products.

MUNGER WINS RIM DECISION.

THE suit of Louis de F. Munger against the Perlman Rim Corporation for infringement of the Munger Rim Patent No. 638,588 of December 5, 1899, has been decided in favor of the plaintiff by Judge Manton, who directed the defendant to account before a master that the plaintiff may recover a reasonable royalty under the rule established in *Dowagiac Manufacturing Co. v. Union Plow Co.* The validity of the Perlman patent is not affected by the decision. The defendant will appeal the suit.

In the opinion of Judge Manton, the Munger patent and Perlman rim alike employ a wedge to secure a tire-carrying rim under tension on a motor car wheel so that the rim shall hug the wheel tightly and be held firmly in position while at the same time it can be detached readily by freeing the wedge surface. The Munger patent, however, antedates Perlman's claims. It is understood that damages, estimated on a basis of reasonable royalty, as stated by Judge Manton, may be recoverable against other rim manufacturers for a period of about 5½ years preceding the expiration of the Munger patent on December 5, 1916. Munger claims that nearly 20 companies have manufactured about 5,000,000 rims infringing his patent, and will probably insist on \$1.50 a set, Perlman's own valuation placed on Standwell rims, as the proper figure.

The Munger rim patent was issued in 1899 to the International Wheel & Traction Co., to which he had assigned his rights. The International lacked capital at the outset and the rims were made for a while by the Munger Vehicle & Traction Co. at New Brunswick, New Jersey. Litigation with the Rubber Goods Manufacturing Co. ensued, and the Munger rights next passed to the National Wheel & Traction Co. This was succeeded in 1902 by the Munger Automobile Tire Co., of Trenton. In 1915 the patent was assigned back to Munger individually.

Should the Munger decision be sustained by the United States Circuit Court of Appeals, the Munger patent would then head the list of wedged-on demountable rims. Meanwhile, however, Erle K. Baker, of the Universal Rim Co., is suing Perlman in Chicago, claiming violation of numerous patents covering the practice of mounting a rim upon a conical seat. Apparently the courts must decide what constitutes a wedge before the present complicated tangle of rim patents can be straightened out.

PERLMAN RIM CORPORATION MOVES HEADQUARTERS.

Alfred P. Sloan, Jr., president of the United Motors Corp., has taken over the management of the Perlman Rim Corp. He has selected Clarence M. Day as his representative in that company, and he has accordingly been elected as president. The head offices of the Perlman Rim Corp., heretofore maintained in New York City, have been removed to the plant at Jackson,

Michigan, which will enable the new president to keep in close touch with the manufacturing end of this corporation.

FRANK E. TITUS.

FRANK E. TITUS, who has just been appointed assistant manager of the foreign sales department of The B. F. Goodrich Co., has shown a steady upward progress in responsi-

FRANK E. TITUS.

bility ever since he entered the employ of that company in 1906. He is a young man, acknowledging July 22, 1884, as the date of his birth at Painesville, Ohio. After a grammar school education at Cleveland, Ohio, and a high school graduation at Bellevue, Ohio, he was employed by the Nickel Plate Railroad for three years and then for a single year with the Ohio Cultivator Co.

In December, 1906, he became clerk in the engineering department of The B. F. Goodrich Co. Four years later, he went to the Buffalo branch of that company as assistant to W. O. Rutherford, then the local Buffalo, New York, manager, but now

general sales manager of the company.

Mr. Titus later was the man in demand. He was appointed manager at Denver, Colorado, only to return to Buffalo as operating manager. Then he was made manager of the Pittsburgh, Pennsylvania, branch in 1914, only to return to the Buffalo store and assume full management last year. Now that the foreign sales department of the company demands a man who has made good, who has been tried and proven, Mr. Titus is again promoted, and is made assistant manager of that department. His past record is an assurance of his success in his new position.

Mr. Titus is a member of the Rotary Club and the Buffalo Chamber of Commerce, in both of which he has always taken an active interest. He is also a Knight Templar and a "Shriner."

THE GOODYEAR'S NEW CANADIAN FACTORY.

The Goodyear Tire & Rubber Co., of Canada, Limited, Toronto, Ontario, has practically completed its new \$1,500,000 factory at New Toronto, a suburb of the city. This is a four-story structure 560 by 100 feet, and has one of the most up-to-date power plants in Canada. This power plant has sufficient capacity for three more similar buildings, and the company has land sufficient for five more units, similar to the one now completed. This factory, which will soon be in operation, has a daily capacity of 3,000 automobile tires. All kinds of pneumatic tires—automobile, motor-cycle, bicycle and airplane—will be made. At the Bowmanville, Ontario, factory will be manufactured mechanicals, molded goods and shoe supplies.

PEARCE-ARROW'S NEW FACTORY.

The Pearce-Arrow Tire & Rubber Manufacturing Co., Philadelphia, Pennsylvania, is starting alterations in its newly acquired plant at Twenty-first and Clearfield streets in that city, and expects to begin manufacturing there some time before the first of next year. This plant, consisting of five communicating buildings of modern brick construction, will give the company a capacity of 1,000 tires a day.

THE CARLISLE CORD TIRE.

The Carlisle Cord Tire Co., Inc., notice of whose incorporation appeared in the June, 1917, number of THE INDIA RUBBER WORLD, will soon put upon the market a cord tire, the invention of F. B. Carlisle, not only novel in itself but made upon equally ingenious yet simple machines designed and constructed by the same inventor. The carcass is made from cotton cord of large diameter, having a tensile strength of 235 pounds. Each cord is surrounded with rubber, which, it is claimed, almost entirely eliminates internal friction. The tread is novel, consisting of two parallel depressions resembling zigzag streaks of lightning, which provide effective non-skid qualities.

The company has secured an entire floor in the fine tire factory of the Tyer Rubber Co., Andover, Massachusetts, where the cord-laying machines are already at work. The vulcanizing is being done by the Tyer Rubber Co., but all other details of construction are entirely separate and distinct from the latter named concern.

The officers of the Carlisle company are: President J. S. Bretz; vice-president, F. B. Carlisle, the inventor; treasurer, Frank Williams, president of the Broadway Central Bank, New York City, and secretary, Frank A. Searles. The general sales manager is Charles A. Gilbert, formerly Pacific Coast manager, United States Tire Co. The principal office is at 250 West Fifty-fourth street, New York City.

THE ROOF GARDEN OF THE COLORADO TIRE & LEATHER CO.

On the evening of June 25 the new roof garden of the Colorado Tire & Leather Co., Denver, Colorado, was opened by a formal dance given by the Executive Club, which is composed of department managers and their first assistants. Speeches were made by officers of the company.

The roof garden was constructed at a cost of approximately \$15,000, and is intended primarily for the social entertainment of employees of the company and their friends. It also affords

an opportunity to obtain well-cooked food practically at cost.

Bert Rhoads, architect for the company, worked out the design. The entrance is surmounted by a glass canopy and a large summer house, to be used as a banquet hall, ball room and lunch room, is the principal feature of the scheme. Swings, rustic benches and tea tables invite relaxation during the lunch hour and also evening amusement if desired.

NEW FISK RUBBER BRANCH AT NASHVILLE.

The Fisk Rubber Co., Chicopee Falls, Massachusetts, is to erect a handsome permanent branch in Nashville, Tennessee, on Eighth avenue, north, and extending through to Ninth avenue. The plans being prepared by Marr & Holman, architects, call for a sales and stock room and also a service station, to be equipped with all modern machinery necessary for repairing tires. The building will be of tapestry brick and thoroughly up to date in every particular. W. E. Cunningham is local manager for the Fisk company.

PERSONAL MENTION.

W. H. Taylor, of Chicago, has become resident manager of the Peoria, Illinois, branch of the United States Tire Co. Mr. Taylor was formerly engaged in specializing among jobbers for United States tires.

William Jameson, assistant superintendent of The Fisk Rubber Co., Chicopee Falls, Massachusetts, has presented the Chicopee Public Library with a magnificent mounted moose head which has been placed in a prominent place in the children's room.

Mark W. Roe, who has just resigned as mechanical and efficiency engineer for the McGraw Tire & Rubber Co., East Palestine, Ohio, to accept a similar position with the Republic Rubber Co., Youngstown, Ohio, has been connected with the rubber industry since 1906, when he became mechanical engineer for the Diamond Rubber Co., Akron, Ohio. He graduated from Cornell University in 1896 and for two years was an assistant instructor there, the next seven years serving engineering and textile concerns, an experience well fitting him for his later work in the rubber industry.

A. T. Severs, formerly assistant manager of the Minneapolis, Minnesota, branch of the Firestone Tire & Rubber Co., Akron, Ohio, has been appointed manager of the Fargo, North Dakota, branch, succeeding W. R. McCarthy resigned.

R. T. Jollie, Jr., has been appointed supervisor of the Ajax Rubber Co., New York City, in Ohio, West Virginia and Kentucky.

B. F. Wulff, formerly connected with the San Francisco and later with the Chicago branch of The Kelly-Springfield Tire Co., has severed his connection with that company to become associated with the McCreary Tire & Rubber Co., Indiana, Pennsylvania, as manager of their sales department.

Robert Cartmell, who has made an enviable record in the Los Angeles, California, branch of the Kelly-Springfield Tire Co., New York City, has been placed in charge of the sales of solid truck tires at the general sales offices of the company, Cleveland, Ohio, where he will work with general sales manager Otis R. Cook.

Charles Schoneman, who has done excellent work in Hackensack, New Jersey, and Baltimore, Maryland, also more recently as division manager, for the Sterling Tire Corp., Rutherford, New Jersey, has been appointed manager of the new Chicago, Illinois, branch of that company.

L. W. Santasiere, formerly with the New York branch of the Firestone Tire & Rubber Co., Akron, Ohio, has been appointed a foreign traveler for the company. He sails shortly for the West Indies, where he will do general sales promotion work.

R. W. Brouse, formerly assistant manager of the Philadelphia (Pennsylvania) branch of The B. F. Goodrich Co., has been promoted to the managership of the company's branch at Buffalo, New York.

IMPERIAL BELTING CO. PROMOTIONS.

Harry E. Dennie, for several years Pacific Coast manager of the Imperial Belting Co., Chicago, Illinois, has been appointed general manager of the company.

W. S. Bloomer, formerly special representative throughout the Western States, has been appointed general sales manager.

Both were originally Chicago men who will be welcomed to their former fields of operation by many friends in the trade. The transfers were made necessary by the rapid expansion of the business and the determination to render the same painstaking service which their many satisfied customers have received in the past.

ACCORDING TO THE "NEW YORK SUN" THE NEED OF RUBBER IN Germany for the uses of war has become so great that even billiard tables are being stripped of their cushions.

TRADE NEWS NOTES.

Charles A. Be Saw, president, and P. P. Parker, general sales manager, of the Be Saw Tire & Rubber Co., have opened temporary offices in the Whittington Hotel, Ardmore, Oklahoma, near the site selected for the new tire factory, contracts for which have been let.

The Ideal Tire & Rubber Co., Cleveland, Ohio, has secured a plot of about 15 acres, in that city, with a good water front and adjoining two railroads. A factory will be erected large enough to turn out 500 casings and 800 tubes per day. The contract for this building has already been awarded.

A conference of division managers of the Marathon Tire & Rubber Co. was held the first week of July at the home office, Cuyahoga Falls, Ohio, to consider taking care of greatly increased business and the national advertising campaign the company is about to launch. H. H. Replogle, manager of sales, gave a dinner to the division managers in conference. The spirit of an unmistakably live and energetic organization was very evident.

A factory for the Crown Tire & Rubber Co., Ralston, Nebraska, is being erected, and it is expected that one floor will be ready for use about August 15. Meanwhile, Crown Cord tires and tubes are being made in a temporary plant. As the business grows, enlargements are to be made to the new plant, according to well defined plans already drawn which contemplate several wings.

The Norwalk Tire & Rubber Co., Norwalk, Connecticut, by leasing the Ash hat factory in South Norwalk, has made it possible to more than double the production of Norwalk tires without waiting for building operations. This arrangement, together with the large addition to the Norwalk plant, now in course of construction, is expected to treble the output next year.

The Lee Tire & Rubber Corp., Conshohocken, Pennsylvania, has developed a cord tire embodying its well-known puncture-proof feature and arrangements are now being made to manufacture them largely for the 1918 output. John Kearns, general manager, expresses the utmost confidence in cord construction and is of the opinion that by 1919 tire manufacturers will be making cord types of tires in greater quantities than the regular fabric type.

Eddie Lingenfelder and Fred C. Rounds are operating an automobile accessories business under the name of Eddie Lingenfelder Co., at 831-3 South Olive street, Los Angeles, California. The store is a Goodyear Service station.

The Cleveland Standard Tire & Rubber Co., notice of whose incorporation appeared in the July issue of THE INDIA RUBBER WORLD, acts as Southern California agent for the tires of the Standard Tire & Rubber Co., of Willoughby, Ohio. The office is located at Pico and Hill streets, Los Angeles, California, officers of the company being as follows: H. M. Lieb, president; E. B. Conlee, vice-president and general manager; E. Leon Sprague, secretary.

The Knight Tire & Rubber Co., Dallas, Texas, has removed to new quarters on Commerce Street.

The Giant Tire & Sales Co., Rochester, New York, expects to have its new Giant tire on the market within the next few months. The company was incorporated in April for \$10,000.

The Perfection Rubber Works, Stamford, Connecticut, has taken a five years' lease of a three-story factory building on Garden street, and will commence manufacturing as soon as the necessary machinery can be installed.

The Boone Tire & Rubber Co., Sycamore, Illinois, has awarded the contract for the erection of the first unit of a third plant to be located at Chippewa Falls, Wisconsin, to cost about \$125,000 complete. Work is already under way and it is hoped to get the plant into operation on August 15 or September 1. The building will be 100 by 200 feet, one and two stories. Elec-

tric motors aggregating more than 300 horse power are to be installed. The main plant of the company is located at Sycamore, Illinois, and a second plant at Des Moines, Iowa.

NEW PORTAGE RUBBER CO. BRANCHES.

B. J. Wildman, who has been made Pacific Coast manager for the Portage Rubber Co., recently opened two direct branches that will be operated under the name of the California Corp., and are located at 855 Traction avenue, Los Angeles, California, and 745 Mission street, San Francisco, California.

The Portage Rubber Co. also operates direct branches at Boston, Massachusetts; New York City; Philadelphia, Pennsylvania; Detroit, Michigan; Cleveland, Ohio; Atlanta, Georgia; Chicago, Illinois, and Des Moines, Iowa.

John H. Diehl is no longer connected with the company and his successor has not yet been appointed.

KELLY-SPRINGFIELD CUMBERLAND PLANT IN PROGRESS.

Final plans have been completed for the new Cumberland, Maryland, plant of the Kelly-Springfield Tire Co., New York City, which is now in process of erection at a cost of between \$4,000,000 and \$5,000,000. The location was chosen as a result of the tempting offer of the land, a bonus of \$750,000 and ten years' tax exemption. The new plant will employ between 3,000 and 5,000 persons at the start and will have a capacity at least double that of the existing plants, including that acquired two years ago at Wooster, Ohio, and that bought early this year at Buffalo, New York.

The company has never attempted quantity production, but the increasing demand for Kelly-Springfield tires has made this important expansion necessary. Never in its history has the company been so far behind on its orders. Gross and net are both showing very large gains over the year to December 31, when a balance of 39 per cent remained for the \$4,907,000 common stock after preferred dividends had been deducted. It is now paying 16 per cent, or \$4 per share, and officials believe it will earn very close to 50 per cent this year.

RACINE AUTO TIRE CO.

The daily production of this firm at Racine, Wisconsin, is to be raised to 7,500 Horseshoe tires and tubes by the erection of new buildings and increase of the force to between 3,000 and 4,000 persons. The new plant will occupy a plot 260 by 320 feet, will be five stories high, and divided into units 60 feet wide with courts 30 feet wide between sections. Reinforced concrete will be used, and the latest machinery and electrical equipment will be installed.

This growing firm began business seven years ago with three workmen and has practically trebled its output in each of the past three years, sales up to June 1, of this year, being 20 per cent greater than for the entire year 1916. For the past year and a half the plant has been in operation day and night, turning out 500 tires and tubes daily for seven branches in the principal cities of the Middle West. The factory is now 60 days behind orders, and because of limited facilities has not been in a position to take on new accounts for over a year.

The officers of the company are L. J. Elliott, president; C. H. Wright, secretary and treasurer.

WILL WHOLESALE ONLY.

The Berrodin Rubber Co., Philadelphia, Pennsylvania, which has been doing a wholesale and retail business in tires and accessories at 713-715 Broad street for the past year, has discontinued its retail department, and will hereafter confine its business exclusively to the wholesale end, catering to garages and supply stores.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

THE northward migration of negroes is becoming a problem in the Middle West. To Ohio, it is estimated, have come during the past year or two 100,000 of the 700,000 blacks who have been known to leave the South seeking advancement. Attracted by the good wages paid by rubber manufacturers, the negro population of Akron has doubled within a year and now numbers about 3,000. A newer and larger negro district with opportunities for thrifty blacks to buy homes on the instalment plan will go a long way toward making the best of the situation, and such a movement must, of course, be worked out by leading business men in conjunction with representative negroes long resident in the city. Given proper home influences and a fair opportunity to work, it is believed these newcomers will become frugal, industrious, law-abiding citizens.

Leading Ohio negroes, ministers, teachers, social workers and members of the State War Board, realize the duty confronting them, and on July 12 some 200 met in Columbus to discuss how to house the negro, how to avoid race troubles, how to make good citizens out of southern negroes, how to put it up to the better class of negroes to see that the newcomers are disciplined, and how to improve the moral conditions in negro districts. Rev. R. A. Jones, pastor of the Second Baptist Church and prominent in negro circles, was present from Akron.

* * *

The regular annual convention of the service men of the Firestone Tire & Rubber Co., at Akron, is an institution of no inconsiderable business and social value to those connected with the large organization, coming from all over the country to meet together at the home office. This year, owing to conditions in national affairs, it was decided to abandon the elaborate plans that had been made for the service convention. But in order not to forego the benefits of this comprehensive review of the year's work and plans for the year to come, the novel plan was adopted of bringing the mountain to Mahomet, or specifically, the convention to the men, instead of the men to the convention.

Various members of the Akron organization who had planned to address the service men during the convention prepared their speeches in written form, one of these being a very interesting treatise by G. R. Lamson, in charge of the Firestone Library, on the value of "courtesy" and "good will" as business assets. These printed talks are being sent periodically to the men in the various cities where the company is represented by branches or agencies.

The stock for which Firestone employes have subscribed under the company's plan to allow its workers to become stockholders will be held by the firm should the employe enlist or be drafted into any branch of government service, payments being postponed.

* * *

The Mason Tire & Rubber Co., at Kent, this state, is progressing with remarkable rapidity. Net earnings for the quarter to July 1 were at the rate of \$300,000 per year. During the past two months the company has paid eighteen months' accumulated dividends due on the 7 per cent cumulative stock. The fore part of August the dividend due on preferred stock from January 1 to July 1 will be paid, and thereafter the preferred stock will be upon a quarterly dividend basis.

Four extensions to the plant are in progress, including a warehouse, mill room, main plant extension and office building. The present average production is 500 tires per day, and by the first of January it is planned to extend the capacity of the plant to 1,500 tires per day.

Four direct factory branches are maintained, at Akron, Cleveland, New York and Kansas City, and additional branches will be opened in the near future. The company is making a popular priced line of plain, ribbed, and non-skid tires and will

have a cord tire on the market by the first of next year.

Recent important acquisitions to the office personnel are Dave Kennedy, formerly advertising manager of the Swinehart Tire & Rubber Co., and John H. Diehl, sales manager, formerly with the Portage Rubber Co. in the same capacity.

* * *

The books of The B. F. Goodrich Co. were closed on July 1 for the purpose of determining the result of operations for the first six months of 1917. They have not been audited by public accountants, but the company's auditor has just submitted to the directors a statement of earnings for the period. After making full provision for maintenance charges, depreciation, doubtful accounts, and all known outstanding current liabilities and accruals, the net profits for the period amounted to approximately \$5,200,000, exclusive of provision for excess profits tax not yet ascertainable.

The Goodrich school offers all employes an opportunity to learn English, free of charge, the classes being arranged so as to make it possible for workers on all shifts to participate. Upon the request of a number of employes, who have realized the growing importance of Spanish as a commercial language, classes for the study of Spanish have also been instituted under the direction of Dr. Juneke.

W. A. Johnson, former assistant, has become office manager of the automobile tire department of The B. F. Goodrich Co., succeeding A. J. Wills, who has assumed special duties in association with H. C. Miller, director of tire sales. Mr. Johnson was at one time general sales and advertising manager of the Pierce Cycle Co., Buffalo, New York.

The Goodrich Girls' Country Club, now being completed at Rex Lake, nine miles south of Akron, is for Goodrich women employes exclusively. Tennis and croquet courts are now being laid out.

* * *

The Goodyear Tire & Rubber Co., in connection with the city of Akron, held a mammoth celebration of Independence Day at the company's recreation park, known as Seiberling Field. There was a grand review of Akron boy scouts and scoutcraft exhibitions, a base ball game, and a concert, followed by a community song festival, the largest affair of the kind ever held in Akron and this part of the country.

A fire on June 16 in one of the concrete storehouses of the Goodyear company, believed to be due to spontaneous combustion among the many compounding ingredients kept in the structure, resulted in damages estimated at \$40,000. None of the manufacturing departments was affected.

* * *

The Amazon Rubber Co. has established a thoroughly equipped chemical research laboratory with H. G. Arbogast in charge. Mr. Arbogast was formerly assistant chemist in one of the large local rubber companies.

* * *

J. W. Rock, vice-president of The American Rubber & Tire Co., Akron, Ohio, announces the marriage of his daughter, Hazel Kirk, to George A. Madole, who is connected with The B. F. Goodrich Co. in a technical capacity.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

SOME of the rubber factories in and around Boston are preparing to shut down a part of this month, but not on account of lack of business. All of them seem to have enough orders on hand to warrant running right along, were the weather better for good work, the employes less desirous of a let-up and a vacation period, and were there no repairs and installations necessary. The rubber shoe factories are pushing ahead on both rubber footwear and tennis goods, for orders keep coming for

the latter despite the fact that the summer is half gone. This state of affairs applies equally to the Boston Rubber Shoe Co. and the Converse Rubber Shoe Co., of Malden, The American Rubber Co., of Cambridge, the Apsley Rubber Co., of Hudson, and the Hood Rubber Co., of Watertown. The belting and packing factories are also busy, the Boston Woven Hose & Belting Co. rushing in practically all its departments, while the demand for jar rings is in millions. The Boston Belting Co. has been running double or triple time a portion of the last two months. The Apsley Rubber Co., Hudson, and the Franklin Rubber Co., of Malden, are making ponchos on government contracts. The Revere Rubber Co., of Chelsea, was never busier, and the same reports or similar ones come from the makers of coated fabrics and artificial leather for carriage and automobile tops and upholstery.

* * *

The Hood Rubber Co. plant, with its recent enlargements, mentioned in a former letter, is just buzzing with industry, and the output shows the remarkable progress of the company's business. The daily product of this big plant includes 40,000 pairs of rubber boots and shoes, 36,000 pairs of canvas footwear, 750 tires, 600 tubes and 80 solid rubber tires. Few companies in the industry can boast of greater progress than has been made by the Hood Rubber Co., which started in one small factory not so very many years ago.

* * *

The Goodyear Tire & Rubber Co. salesrooms in this city are on Boylston street in the automobile district, where the company occupies a handsome business building including fine showrooms. But this is certainly an inconvenient place for footwear men to visit and the company has just opened a sample room for the sale of its "Neolin" soles in the heart of the shoe and leather district, at 283 Essex street. This office is in charge of J. H. Willett, who serves as special representative for these soles to the wholesale trade. Mr. Willett has a wide acquaintance in the footwear trade, having traveled over the entire country for prominent firms as well as with shoes made in his own factory. His retirement from the shoe manufacturing business a year or two ago was preliminary to forming this business connection with the Akron company for presenting to the shoe manufacturers of the country the advantages of this now well-known substitute for leather, used in bottoming shoes.

* * *

The Fisk Rubber Co., Chicopee Falls, this state, has one of the largest and most successful factory athletic organizations in the country. It is organized under the name of the Fisk Athletic Association, and is a registered member of the A. A. U. Some 2,500 employees, with paid-up memberships, are enrolled. The activities are all in the hands of the employees, governed by elected officers and committees, and a board of directors. It not only supports an all-star baseball team, known as the "Red Tops," but conducts a league of six teams, all Fisk workers, and these teams are playing excellent baseball, and affording recreation for the employes of all departments. As has been previously mentioned in these columns, the company has a fine athletic field, 20 acres in extent, where these games are played, and where other athletic sports are indulged in by the workers at the factory. The association has furnished uniforms, bats, balls, bases, etc., for these teams, between which much good-

natured rivalry abounds. A recent success of this association was the staging of a first-class track meet, to which were attracted a number of the leading amateur and college stars of New England.

* * *

E. M. & F. Waldo, manufacturers and dealers in compounding ingredients and colors, New York City, have opened an office in the new Rice Building, 10 High street, Boston, in order to take better care of their increased business in this territory. This office is in charge of Townsend H. Cushman, who has been with the house for several years and is well known to the New England trade.

* * *

The Pneumatic Cushion Inner Tube Co., of this city, which is exploiting a rubber cushion filler to take the place of an air-filled inner tube, has made arrangements to have its product manufactured at Canton, this state. It is rumored that there is a possibility that the government will adopt this non-collapsible tube for army vehicles.

* * *

Ellis F. Harlow, son of President Robert C. Harlow, of the Monaquot Rubber Works Co., South Braintree, has enlisted in the First Massachusetts Engineers, which regiment will be called on July 25. This regiment was formerly known as the First Corps Cadets, whose history dates back to 1776.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

APPLICATIONS that are interesting to the rubber industry have been made to the Warren Town Council for exemption from taxation on proposed new buildings and land of three corporations which are contemplating locating in Warren. The petitions were received at a meeting of the Town Council early in the last month and after an informal consideration were continued for action at some future meeting.

The corporations seeking exemption from taxation for ten years are the American Web Co., which is to manufacture narrow fabrics, and is located at Boston; the Deaudelion Fabric Co., to manufacture tire fabric, and the Lynn Manufacturing Co., of Lynn, Massachusetts, manufacturing rubber heels, soles and arch supporters. The town clerk was authorized to correspond with these concerns, notifying them to send representatives to confer with the members of the council.

* * *

A chicken dinner and an extended program of athletic contests featured the annual outing of employes of the Davol Rubber Co., Providence, July 14, at Doby's Grove. With respites for dinner and luncheon, the sports continued from the arrival of the party in special electric cars shortly after 9 o'clock until 4 o'clock, after which dancing became the form of entertainment. Prizes in the sport events were awarded.

* * *

The National India Rubber Co., Bristol, has had a considerably higher valuation placed upon its property in that town by the tax assessors this year than that in 1916, following the construction of numerous additional buildings, the improving of the old structures and the introduction of new machinery and equipment. The valuation now is \$790,000. Last year it was \$555,000. The company will pay a tax this year of upwards of \$13,000.

One of the most attractive features in the Fourth of July parade at Bristol was the appearance of 60 young women employed in the stitching room of the National India Rubber Co., who paraded as Red Cross nurses.

* * *

The Bourn Rubber Co., Providence, is calling for experienced shoemakers, also young women to learn.

A contract has been given for the erection of a building for

J. H. WILLETT.

office and shipping room at the Anchor Webbing Co.'s plant, Pawtucket. The new building will be brick, mill construction, 53 by 60 feet, two stories, to cost \$12,000.

An extensive system of fire escapes has recently been placed on the buildings at the plant of the Atlantic Tubing Co. at Knightsville.

Hill & LaCrosse, manufacturers of elastic webbings, have been building an extension to their plant at Howard.

The Revere Rubber Co., Providence, is calling for girls over 16 years of age, for warping and table work, in its rubber thread department. The concern is very busy and is furnishing employment for a large number of new hands in the various departments.

The Bay Spring plant of the International Rubber Co., at West Barrington, has been working on night and day shifts the past month to fill orders for a carload of rubber goods a day. It is expected that this schedule will be continued indefinitely.

THE RUBBER TRADE IN TRENTON.

THE Home Rubber Co., manufacturing mechanical rubber goods, has acquired a 50 by 100 foot site, adjoining its plant for the erection of an addition.

* * *

Sensible one-piece bloomers and blouses of durable, medium-weight blue fabric are being adopted by the girls employed by the Semple Rubber Co., maker of inner tubes. The wider employment of women in rubber and other manufacture everywhere

seems inevitably to be leading to this dress reform which appears to have come to stay. It provides a comfortable working uniform permitting full freedom of action and saving the street clothing.

* * *

The Dural Rubber Corp., recently incorporated with a capital stock of \$200,000, has acquired a five-acre site with buildings at Flemington, New Jersey. The main structure, 40 by 200 feet, is a model of its kind, embodying the day-light feature and served by a spur track from three railroads. The new works will be devoted to the manufacture of aircraft rubber equipment, automobile tires, tubes, sundries and molded rubber goods, which will be sold under the registered name of Dural.

The officers of the company are Edgar H. Wilson, president and general manager; W. C. Ehrenfeld, vice-president; Caleb S. Green, treasurer; G. F. Gingen, secretary. The directors include Newton A. K. Bugbee, comptroller of the State of New Jersey; J. E. Gill, J. G. Conner and J. R. Hall.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicated with him.

[310.] Names of manufacturers of a machine for making rubber balls or bulbs are requested.

[311.] A correspondent wishes to know where he may obtain rubber poker chips.

[312.] Names of manufacturers of serial numbering machines for stamping numbers on thin metal strips, are sought.

[313.] An inquiry has been received for names of manufacturers of machinery used in making adhesive tapes.

[314.] Names are desired of makers of machines used for applying starch, bone black and other powders to sheet rubber.

[315.] We have an inquiry for gasoline cans used by tire makers.

[316.] Tire building machines are sought.

[317.] A correspondent desires to be furnished with a list of manufacturers of aldehyde ammonia crystals.

[318.] A correspondent wishes to know where the various parts for fountain pens may be obtained.

[319.] A correspondent is in the market for a fabric inspection machine.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

A complete collection of samples of various prices, discounts, etc., of imitation leather is desired by a firm in the British West Indies. Report No. 24,742.

An agency is desired by a company in Italy for the sale of vulcanized fiber and ebonite. Report No. 24,770.

A firm in Italy wishes to purchase imitation leather. Report No. 24,775.

A company in Sweden desires to be placed in communication with American manufacturers and exporters of rubber, automobile tires, etc. Report No. 24,778.

An agency is desired by an applicant in Italy for the sale of artificial leather. Report No. 24,780.

A man in France wishes to represent American manufacturers and exporters of artificial leather and leather substitutes used for automobile tops, etc. Report No. 24,785.

Catalogs and price lists are desired by a man in Spain for rubber hose. Report No. 24,843.

An import agent in Russia desires to be placed in communication with American manufacturers or exporters of pneumatic tires. Report No. 24,845.

Communication is sought by a business firm in Russia with American dealers in raw rubber. Report No. 24,864.

Quotations are desired by a firm in East Africa for lead pencils, with and without erasers. Report No. 24,867.

A dealer in haberdashery goods in East Africa wishes to purchase cheap grades of men's garters. Report No. 24,901.

A manufacturer's agent and importer in New Zealand wishes to be placed in touch with manufacturers of all sizes of suit cases, in canvas, fiber and imitation leather. Report No. 24,962.

A company in the Dutch East Indies desires to purchase rubber and linen collars and cuffs for army officers. Report No. 25,004.

OLD RUBBER AND RUBBER HOSE ARE AMONG THE MATERIALS condemned as unfit for use and listed to be sold at the Navy Yard, Puget Sound, Washington. The sale will be for cash to the highest bidder by sealed proposals to be opened at 1 p. m., August 17, 1917. Schedules containing form of proposals can be obtained upon application to the Supply Officer, Navy Yard, Puget Sound, Washington.

The Rubber Trade in Great Britain.

By Our Regular Correspondent.

WITH regard to business conditions generally there is no change of note to record in the situation, which may be summed up in the statement—great activity where government contracts are concerned and slackness amounting in cases to depression in general home and export business. The bogey of dearer rubber has been scotched by large arrivals and there is now no rush to provide for anticipated needs. The topic of the moment is the price of cotton rather than rubber, and there seems little doubt that a more or less prolonged era of short time or knocking off of a certain number of looms, which amounts to the same thing, is in store for Lancashire.

A sensation of the first half of June was the rapid appreciation in the market value of the Parent Tyre Co., Limited, (Dunlop) on account of the anticipated combination among tire manufacturers which at the time of writing has not yet matured, or, at any rate, been announced.

With regard to the market premium on Brazilian Para rubber this is really to-day a greater compliment than it was five or six years ago when the premium was the same, and this because it is generally noted in the trade that the loss in washing is higher than it was, *viz.*, 18 or 19 per cent more against the old figures of 15 or 16 per cent. This is put down to the greater rapidity in getting the rubber in the market and the consequent decreased loss of moisture by evaporation.

RUBBER-FACED CARD CLOTHING.

A branch of the rubber industry which has been hit by the war is that of rubber-faced card clothing for use in textile mills. Not only is the export trade disorganized but the regulations with regard to the sale and purchase of the steel rods from which the wire joints are made are such as cause difficulties and embarrassment in the manufacture. This business is carried on in various factories in Lancashire and Yorkshire, specially devoted to it and not in what may be termed rubber works proper. Some of the card clothing is made with vulcanized rubber and some with pure rubber and the old rubber from the latter, always of the best quality, is constantly in demand by reclaimers.

RUBBER RECLAIMING.

This leads me to refer to the fact that a new reclaiming works has been started at Fielding Mills, Middletown, near Manchester, by Stead-Hunt, Limited, which, if my memory serves me rightly, was a name associated with the artichoke synthetic rubber business which commenced its short-lived career at Handforth four years ago. The new reclaimed rubber is called Russam and is said to be made by an entirely new and original process with the use of acid or alkali. Of course, a good deal of rubber has been reclaimed in the past, and is no doubt at present, without the use of acid or alkali, but it will be for the astute rubber manufacturers to determine whether reclaimed made without acid or alkali is superior to that made with these auxiliaries, and the matter can safely be left to their judgment. It has surprised many readers on this side to see in a recent number of THE INDIA RUBBER WORLD a reference to a legal decision regarding the alkali patents. Presumably the explanation is that patents have a longer life in America than they have here, any extension of a patent over its 14 years' span being very rare with us. With the expiry of the Mark's "alkali" patent in England four years ago there is now no question of any litigation among the three or four concerns working the alkali process in England.

Delivery of rubber machinery to orders which are readily quoted for and taken is still a matter of great delay and un-

certainty and is the main reason for the slight progress made with regard to projected developments.

A BIRTHDAY HONOR.

Sir Frederick H. Smith, Bart., has been created a baron of the United Kingdom and has taken the title of Lord Colwyn, from the resort on the North Wales coast, where he has a residence. Although a commercial magnate of varied activities and business associations, he is, of course, best known to the rubber trade as chairman of the Charles Macintosh Co., Limited, and some of their subsidiary undertakings. Better known in Lancashire than in London, it was not altogether surprising that on one occasion a few months ago, when his name became prominent in connection with the report of a tariff committee, some of the London papers confused him with Sir Frederick Smith, the Attorney-General. The latter, who is a Unionist, does not see eye to eye with the new peer, who belongs to the opposite camp. So, no wonder certain leading writers were bewildered at what seemed a very rapid change of opinion even in these days of chameleon procedure.

DISASTROUS FIRE.

On June 13 a fire, followed by an explosion, occurred at the works of the Hooley Hill Rubber & Chemical Co., about seven miles from Manchester, with the result that the works were entirely destroyed, the managing director, H. S. Dreyfus, being among the 41 persons killed. The death roll was added to by persons in the vicinity of the works at the time of the explosion, a great many of those employed in the works having managed to get into safety when the alarm of fire was given. Mr. Dreyfus, no doubt, could have saved his own life had he not remained to see that others had warning and assisted in the attempt to subdue the fire. It was at this works that the experiments with accelerine (para nitroso dimethyl aniline) were carried out and a part of the business of the works recently has been the manufacture of this accelerator for sale to rubber works.

DUNLOP INCREASES ITS STOCK.

At a meeting of the shareholders of the Dunlop Rubber Co., Limited, London, on June 22, the capital stock was increased to £6,000,000 by the creation of 3,000,000 new 7 per cent preference "C" shares of £1 each, 10 shillings per share to be called up at once and the balance not for a year at least. The borrowing powers of the board of directors were also increased from £300,000 to £3,000,000.

So rapidly has the business of this company been growing, particularly in the new mill completed May 1 for the manufacture of solid tires for army transport, that last November £1,000,000 in 6½ per cent cumulative "B" preference shares were created in order to double the stock of raw materials as a war-time safeguard and to finance the manufacture and sale of solid tires. Raw stocks were, however, increased to over £2,250,000, an excess of £720,000 over and above the £750,000 intended for that purpose. This must be deducted for the fresh capital, and the balance, roughly £500,000 after the payment of expenses, will be used to finance greatly increasing normal business.

In his address moving these increases, Acting Secretary A. Cunningham referred enthusiastically to the cotton mills and rubber estates of the company, both of which investments had been made at a particularly fortunate time and had proved an unqualified success. The profits and savings of the mills had equaled their initial cost and equipment, and the profits of the estates, embracing 27,000 planted acres, were now approaching the profits made a few years ago by the Parent Tyre Co.,

Limited, and the Dunlop Rubber Co., Limited, itself. He also declared the rumor of the absorption of the shares of the Parent Tyre Co., Limited, or any amalgamation of that company with other British or American firms was unfounded. Negotiations had been in progress, but had been terminated and withdrawn.

SOCIETY OF CHEMICAL INDUSTRY.

This society has issued the first of its annual report on the progress of applied chemistry, Dr. Henry P. Stevens being the compiler of the section relating to india rubber. The reports form a useful and handy summary of recent progress in various trades and manufactures and are largely concerned with the work of the research chemist. The india rubber manufacturer, we all know, is not particularly communicative, so it is not surprising that the pages compiled by Dr. Stevens deal more with what may be described as pure chemistry than with actual works practice, abstracts of most of them having already come before those interested by way of the trade journals.

The society holds its annual meeting, now known as a chemical congress, at Birmingham this summer, and it is interesting to note that two papers by rubber works chemists are listed. One is on "The Chemistry of Vulcanization," by Dr. D. F. Twiss, of the Dunlop Rubber Co., Limited, and the other by B. D. Porritt, of the North British Rubber Co., Limited, on "The Scientific Needs of the Rubber Industry."

Among the works to be visited by parties of members is the Dunlop rubber factory, and it is requested that no one connected with the rubber industry will apply for a ticket. It is also stated that only members who are British born will be admitted at the present time to the majority of the works to which visits have been arranged.

THE INEQUITY OF THE EXCESS PROFITS DUTY.

Now raised from 60 to 80 per cent, the British excess profits duty in its relation to rubber producing companies is the cause of constant discussion and correspondence, leading, it is asserted, to glaring instances of inequity and absurdity in the manner of its application. In a letter recently addressed to all members of the House of Commons, suggesting an amendment to the Finance Bill before Parliament, in order to mitigate the handicap suffered by the younger companies, Messrs. Gow, Wilson & Stanton, London, showed the injustice of the so-called Vallambrosa judgment, in pursuance of which all expenditure of a recurring nature on maintenance during the immature stage of a rubber plantation, is deducted from the profits in order to compute the income for income tax, irrespective of whether the source of the funds for this expenditure is capital or not. This judgment, it was explained, affects illogically the progressive old producer and the young producer. For instance:

The old progressive producer planted up to 1906, 750 acres; in 1908-09, 700 acres; in 1910-11, 700 acres, making a total of 2,150 acres. The high profits derived from the old areas during 1911, 1912 and 1913 would be reduced to a fictitiously low level by subtraction of the cost of maintaining the still immature areas. But the profits from the 1908-9 and 1910 plantings coming into bearing after the war, would not be similarly reduced. Consequently the taxable incomes would work out as follows:

Year.	Actual profit.	Expenditure on immature area.	Statutory income.
Pre-war 1912.....	£30,000	£10,000	£20,000
Pre-war 1913.....	32,000	7,000	25,000
Post-war 1914.....	37,000	2,000	35,000
Post-war 1915.....	55,000	nil	55,000

On the other hand, the young companies formed in the years 1909 and 1910 with very small areas, subsequently received funds for the purpose of opening up large areas during 1911, 1912, 1913 and 1914. The small early plantings would naturally yield but little profit, whereas the later areas, coming into bearing after

1913, would throw off proportionately more and comparison of pre-war and post-war gains would show an excess profit which in fact did not exist.

CEYLON SHIPMENTS CURTAILED.

The British Shipping Ministry has ordered that Ceylon place rubber last in her exports to Great Britain, which means shutting it out altogether. This does not affect shipments to America and Australia. Strictly limited freights prevent large quantities from going to the latter country. It is, however, hoped that America will increase her imports, for while up to May 7 England obtained over 12,000,000 pounds of rubber against less than 7,000,000 last year, the United States bought under 6,500,000 pounds against 10,000,000 to date in 1916.

Meanwhile, Great Britain has given preference to the Federated Malay States, which have only rubber and tin, with coconuts a bad third, whereas Ceylon has several strings to its bow, notably tea and copra.

LABOR TROUBLES IN RUSSIA

MANUFACTURERS of rubber goods in Russia are having their full share of difficulties incident to the present social and political upheaval, according to the correspondent of the "London Daily Telegraph," who is quoted by "The Indian Rubber Journal."

It seems that one morning a delegation of 50 to 60 men, representing the 20,000 hands at the Petrograd works of the Treugolnik Rubber Co., went to the directors asking for a raise of 15 copecks an hour in wages since the beginning of the war and also settlement of a claim rejected by the courts several years ago. The total was 11,000,000 rubles, and they had all brought linen bags expecting immediate payment.

The directors, who had always prided themselves on the cordiality of their relations with their men, argued the case patiently but unavailingly, pointing out that the usual war bonus had been paid, that privileges not enjoyed in other factories had been extended, and explaining the impossibility of meeting such demands. Reference to the Central Board of Conciliation was suggested, but the men only threatened to throw the directors into a nearby malodorous canal. It was then decided to request the Minister of Industry and Commerce to take over the management of the company, and the Minister of Justice and the Council of Workmen's and Soldiers' Delegates were notified to that effect.

The men thereupon raised their demands to 12,000,000 rubles, placed the five directors present under arrest and took them to the Ministry of Justice where they were detained until evening. Meanwhile, an influential member of the Council of Delegates, Gvosdeff, with much difficulty, induced the men to place their claims before the Central Board of Conciliation.

FOREIGN TRADE REPORTS. AUSTRALIA.

IMPORTS from the United States show a marked increase. For the fiscal year ended June 30, 1916, the value of manufactures of rubber was \$2,380,993. For the first quarters of 1916 and 1917 the values were \$61,245 and \$60,710, respectively.

During the fiscal years 1915 and 1916, the United States exported to New South Wales:

	1915.	1916.
Tires	\$214,189	\$1,618,703
Treads, etc.	6,940	7,946
Rubber boots and shoes.....	107,151	49,662
Gum and wading boots.....	10,195	19,892
Totals	\$338,475	\$1,696,203

The large increase in the sale of American cars and tires resulted from a personally conducted campaign, with Australian

supply depots managed by experienced Americans, and with extensive advertising in local newspapers and magazines; another factor was the difficulty of importing from Europe. According to "The Australian Motorist," the demand is for low-priced cars and the American manufacturers are getting the business. It is stated that there is not an American car in the Commonwealth costing more than \$2,554.

CEYLON.

Exports of rubber to the United States during the first quarter of 1917 were 6,968,047 pounds, valued at \$4,204,506.

SIAM.

(Vice Consul Carl C. Hansen, Bangkok.)

During the fiscal year ended March 31, 1916, 37 motor-cycles were landed at the port of Bangkok, against 25 for the previous year, and their declared value was \$7,730 and \$4,639, respectively. The imports of bicycles advanced from 1,196 machines, valued at \$19,872, in 1915 to 1,281 machines, valued at \$24,598, in 1916.

The value of the rubber-tire imports for motor-cycles and bicycles was \$9,590 for 1915 and \$14,551 for 1916. All of this trade is chiefly British.

The import duty on all kinds of cycles and parts, including rubber tires, is 3 per cent ad valorem.

SPAIN.

The accompanying figures show the imports of rubber and its manufactures for the years 1915 and 1916:

	1915.		1916.	
	Metric Tons.	Value.	Metric Tons.	Value.
India rubber, gutta percha and substitutes				
Unmanufactured	948	\$1,109,531	1,697	\$1,986,278
Tires	281	981,305	578	2,030,837
Other manufactures of	389	866,305	484	889,507
Totals	1,617	\$2,957,141	2,759	\$4,906,622

The chief countries of origin of tire imports during 1915 were:

United States.	France.	Great Britain.
\$21,337	\$407,865	\$172,551

SWEDEN.

Owing to the scarcity of rubber, Goteborg factories dependent upon rubber for raw material have been closed and practically all automobiles and taxicabs in the city and district have been put out of commission. The exportation from Sweden of parts of flying machines and airships, and also of air balloons and parts has been prohibited.

EXHIBITION OF TOYS, GAMES, SPORTING AND GYMNASTIC GOODS IN VENICE.

The organizing committee of the National Industrial Exhibition of toys, games, sporting outfits, and gymnastic apparatus, which is to be held in Venice next September, announces that although the exhibition is intended for Italian manufacturers, it is desired to display a few good productions of a similar nature manufactured by the Allied nations, in order that Italian manufacturers and the general public may have an opportunity of seeing what friendly nations have accomplished in these industries which before the war were extensively carried on in Germany.

RUBBER GOODS IN GREECE

Conditions brought about by the war are continually causing new markets to be opened for various products. Thus, whereas Austria and Germany formerly supplied Greece with three-fourths of the rubber goods needed there, they are now off the market, and the United States ought to be able to furnish them. American firms contemplating the establishment of business relations with Greece should remember the importance of having a commission agent there fully trusted and familiar with all local needs and customs, and above all, familiar with the language.

THE SITUATION IN THE DUTCH EAST INDIES.

By a Special Correspondent.

THE shipping difficulties are causing the accumulation of large quantities of various products, including rubber. Naturally this condition is regarded with a certain amount of anxiety and the question has been raised whether it was advisable to build large warehouses for storing these goods. In view of the possibility of further shipping hindrances and of deterioration in the quality of the goods, due to climatic influence, the suggestion has gone forth to establish markets in America whence the products could be further distributed. This is urged as a more feasible plan, especially as even before the war large quantities were consigned to New York instead of to Holland.

RUBBER FACTORY IN BATAVIA.

Industries here are making great headway and the government is fortunately far-sighted enough to see the importance of supporting them. It has, therefore, liberally subsidized several companies carrying on operations in Java.

A rubber factory, running along the same lines as the one at Singapore, has been opened in the east end of Batavia. It covers an area of 1,500 square meters and has been equipped with the most up-to-date machinery. Rubber goods of many kinds previously supplied by Germany will be produced and orders have already been booked for a long time in advance.

CENTENARY OF THE BUITENZORG BOTANICAL GARDEN.

On May 18, 1817, a botanical garden was founded at Buitenzorg, which has not only developed into one of the greatest botanical institutions in the tropical world, but has become a center for the scientific study of the tropics in general.

After half a century of more or less retarded progress the garden suddenly began a more rapid development. It became a power in the economic position of the Dutch colonies in the East; new crops were introduced and seeds of those already known were more widely distributed. Expeditions were undertaken to discover what products of economic importance flourished in a wild state in these islands—several journeys having been made in search of lactiferous plants, for instance—and plants thus found were often cultivated.

Besides this, laboratories were erected, diseases studied and selections made. Soon, also, experiment stations were organized, demonstration fields were laid out for the benefit of the small landowner and agricultural instruction was given through investigations in the laboratory concerning the crops, especially those cultivated by the natives. When the questions with which the institution occupied itself encroached more and more on purely economic ground, the Department of Agriculture was founded, to which was added at a later period a section for Industries and Commerce.

It had been planned to celebrate the centenary of this unique establishment with due solemnity, but present conditions have made it necessary to postpone festivities until after the war.

GOVERNMENT RUBBER PLANTATION TO BE SOLD.

In connection with the government's decision to offer the state rubber plantation at Langsar, Sumatra, at public sale, it has been proposed to announce the sale at so early a date and to make such arrangements for inspecting the estate as to enable prospective buyers in Europe and America to communicate with their representatives here. Considering the present difficulties of communication, it cannot be said that the government has chosen a very favorable time for the sale.

RUBBER CULTIVATION IN TAPANOELI, SUMATRA.

Until quite recently the residency, Tapanoeli, on the west coast of northern Sumatra, did not boast a single European planting enterprise. Now, however, there are several flourishing plantations, new ones are being constantly opened up and the whole

residency is practically overrun by surveyors and prospectors.

Rubber is the chief product, and of the three principal companies, the Sumatra Caoutchouc Plantage Maatschappij is the most important, having five estates of which the largest, Batang Toroe, is the finest in all Tapanoei. The factory is worked by steam. There is an up-to-date central hospital with separate wards for infectious diseases and directed by a European doctor. Both here and on another of the company's estates are comfortable clubs much frequented by neighboring planters.

The Rotterdam Tapanoei Cultuur Maatschappij began with a capital of 2,000,000 guilders [\$800,000]. In 1915, the production of rubber from this estate was 313,027 pounds. Here, too, there is a club, a good hospital and a motion picture theater. The factory is run by electricity and, like all other buildings and houses on the estate, is electrically lighted.

Almost all companies employ contract coolies from Java, and medical aid, hospitals and proper sanitation are amply provided. The various planters have formed an association which works for the general good of the district.

The center of all this is the little town of Batang Toroe, whence the rubber and other products of the neighborhood are forwarded by automobile trucks to the seaport, Sibolga, for export. There is also a government automobile service running between the port and Padang Sidempoean, which touches Batang Toroe, and there are very definite plans for connecting the latter place with Sibolga by rail. All indications point towards the future importance of Batang Toroe and to the significance of Tapanoei as a rubber-producing country.

NATIVE PLANTATIONS.

Urged by the government to develop the cultivation of rubber, the natives of Djambi and Palembang, Sumatra, began planting rubber trees with more zeal than knowledge. Consequently, the native holdings are generally miserable sights. Trees having a girth of barely 15 cm. at a height of one meter are tapped with appalling frequency. At present native rubber sells from 15 to 20 per cent below European rubber and there is reason to expect that unless something is done in time, this difference will increase. It appears that steps are being taken to remedy the condition by appointing European inspectors and instructors, but it is feared that by the time such corrective measures will have actually been put in practice it will be too late. Meanwhile, about 4,000,000 trees have been planted by natives in Palembang, and according to authorities, 50 per cent may, with proper care, reach the bearing stage and for years to come will yield about two pounds of rubber per tree.

RUBBER IN EAST JAVA.

The cultivation of *Hevea* is progressing steadily and trees are rapidly coming into bearing condition. The following figures obtained from one estate illustrate this: The area of the estate is 25,000 acres; at the beginning of 1915, a yield of 1,557,317 pounds of rubber was obtained from 435,039 trees and at the end of 1916, the production from 964,045 trees was 3,375,147 pounds. For both years the average per tree was about 3½ pounds.

According to reports from Wlingi, abnormally heavy rainfalls are interfering with tapping and much anxiety is felt concerning the rubber yield.

RUBBER COMPANIES.

The fusion of five rubber companies is announced, namely, the Bajan Sumatra Rubber Co., the Langsar Sumatra Rubber Co., the Plantation Co. Dolok Marangir, the Rotterdam Langkat Rubber Co., and the Rotterdam Deli Hevea, Limited. The new company thus formed is known as the N. V. Vereenigde Indische Cultuur Ondernemingen, and has a capital of 10,000,000 florins [\$4,000,000].

The Lampong Sumatra Rubber Co., lately founded and having a capital of 900,000 florins [\$360,000], has taken possession of all the property of the N. V. Lampong Caoutchouc Co.

The issued capital of the Bandar Sumatra Rubber Co. has been increased by 500,000 florins [\$200,000], so that at present it amounts to 1,100,000 florins [\$640,000]. The authorized capital, 2,500,000 florins, [\$1,000,000], remains unchanged.

The Amsterdam Java Rubber Co. has reduced its authorized capital to 300,000 florins [\$120,000], while 300,000 florins new capital has been issued.

A NEW DUTCH TRANS-PACIFIC STEAMSHIP LINE.

Two large Dutch steamship companies, the Netherlands Royal Mail Line and the Rotterdam Lloyd, have combined to run a semi-monthly passenger and cargo service from Batavia to San Francisco with Singapore, Hong Kong, Nagasaki, Yokohama and Honolulu as ports of call. The vessels to be employed, which number eight, are large ocean-going steamers, most of which have hitherto been running between Batavia and Rotterdam, *via* Suez, and they will make the trip from Yokohama to San Francisco in about 17 days.

TAPPING ON ONE OF THE SUMATRA PLANTATIONS OF THE GENERAL RUBBER CO.

It appears that for some time at least there is little likelihood of cargo being accepted from Japan, as all available space will have been booked in Java and Singapore. The rate from Japan to Java will be 22 yen* per ton. Cargo from Yokohama has hitherto been transhipped at Kobé, and thus costs 3 yen more (or 25 yen in all) per ton than cargo from Kobé. The rate by the Japanese subsidized lines is about 14 yen per ton.

DUTCH PLANTATION COMPANIES INCREASE CAPITAL.

Two companies in Dutch East Indies have recently increased their capital. The Javasche Cultuur Maatschappij to 5,000,000 florins; the Nederlandsche Gutta Percha Maatschappij is offering its shareholders the opportunity of subscribing for additional shares to the amount of 300,000 florins, and the Amsterdam-Tapanoei Rubber Cultuur has under consideration the doubling of its capital to 2,000,000 florins.

PRODUCTION OF GUTTA HANGKANG.

The latest statistics for Gutta Hangkang show that the production for the year 1916 amounted to 2,296 tons, as against 2,466 tons in 1915 and 1,905 tons in 1914.

This product is obtained exclusively in Borneo and is exported chiefly to Singapore where the bulk is purchased by America.

JAPANESE, CHINESE AND GERMAN BANKS.

The "Indische Mercuur" questions whether those banks which have continually increased their capital will be able to invest large sums profitably after the war. The fact that Japanese merchants are settling more and more, and that the position of the Japanese and Chinese banks will consequently be strengthened,

*Yen = 2s. 0½d.

is regarded with some apprehension. Moreover, there is a large German population that desires to have its own bank, and rumors are already heard that the Deutsch-Ost-Asiatische bank intends to establish one or more branches.

THE 1916 RUBBER PRODUCTION IN THE DUTCH EAST INDIES.

It appears from the statistics compiled by "Netherland-India News" that the direct exports of plantation rubber from the Netherland-Indies amounted to 15,121 tons during the first half of the year 1916, as follows:

Java	tons	5,498
Re-shipments		622
		6,120
Outside districts		9,001
Total		15,121

The 622 tons from other localities, which were sent to Java for re-shipment to foreign countries, were primarily destined for the Batavia market, and originated for the larger part from Tapanoeli (221 tons), Lampongs (194) and West Borneo (76).

The total product of the Netherlands-Indies for the year 1915 was only 20,100 tons.

THE SITUATION IN MALAYA.

By a Special Correspondent.

MALAYAN COMMERCE.

VIEWED as a whole, business during 1916 was distinctly satisfactory. Money is plentiful and no failures of importance have been recorded. Figures show an all-round increase, though in the case of imports, the actual volume of trade was less than in pre-war times. Importations from Japan, however, have been growing rapidly, while the fact that the export trade—chiefly rubber and tin—with America *via* the Pacific Ocean, is undergoing an equal degree of development, is admirably illustrated by the following figures:

Tons.			
1913.	1914.	1915.	1916.
2,800	3,800	13,000	15,200

Shipping difficulties are causing a great deal of anxiety, and it is feared that if conditions continue getting worse, the trade record for 1917 will fall greatly below that for the past year. At Penang, the arrivals and gross tonnage for 1915 and 1916 were:

	Ships Entered at Port.	Gross Tonnage.
1915.....	2,284	2,813.061
1916.....	2,209	2,577.020
Decrease	75	236,041

In spite of this condition, shipments of rubber were larger than ever. Singapore noted an increase of 60 per cent over the previous year, while from Penang exports of rubber for 1916 were 17,850 tons as compared with 14,738 tons during 1915—a difference of 3,112 tons. Prices for rubber were considered satisfactory. In the Federated Malay States, 2s. 1½d. was the lowest price obtained for Smoked sheet; at Penang, First latex brought prices ranging from 3s. 8½d. to 2s. 2½d. per pound.

The motor trade, which experienced a setback during 1914 and 1915, is recovering rapidly, due to the prosperity of planters and miners, who can take advantage of the fine roads through magnificent tropical scenery. The wealthier Chinese, however, are the best customers, since they are rarely satisfied with one car when once they take to motoring. It also seems likely that there will be a big demand for motor tractors in the near future.

The following figures show that the larger part of the supply comes from the United States, although in 1914 the United Kingdom leads:

	1913. £ Sterling.	1914. £ Sterling.	1915. £ Sterling.
United States	149,503	65,884	52,073
United Kingdom	133,709	88,429	29,521
Belgium	5,086	834	...
Germany	4,831	1,852	...
France	1,644	858	1,338
Italy	1,283	1,364	1,050

The total imports of cycles, automobiles and accessories at Straits Settlements ports were as follows:

	£ Sterling.
1913	323,824
1914	169,301
1915	93,622
1916 (nine months)	260,983

For the Federated Malay States the values were £129,816 and £44,060 in 1914 and 1915, respectively.

BANGKOK TO SINGAPORE BY RAIL.

Thanks to the energies of the general manager of the F. M. S. Railways, the Bangkok-Penang line has been completed, and it is now possible to travel from Bangkok, Penang and Kuala Lumpur to Singapore by rail. The construction of this new

SPECIAL TRAIN PASSING THE MARBLE HILL NEAR IPOH, PERAK, FEDERATED MALAY STATES.

line will undoubtedly play a great part in the development of the rich kingdom of Siam, and the Malay Peninsula may confidently look forward to a share of the benefits flowing therefrom. Penang, as the only deep-water outlet on the west coast of the peninsula, from Burma down, is certain to gain in importance.

INDIAN LABOR.

In a previous letter, mention was made of the existing difficulties in connection with the labor question. It can, therefore, be imagined that the news that the Madras Government had ruled that from April 1, 1917, immigration to the Federated Malay States would be limited to the lowest possible minimum, was received with anything but pleasure. It is hoped, however, that some arrangement will be made whereby the difficulties, thus augmented, may be diminished.

THE MALAY HOLDING.

Attention has lately been called to the hidden danger in the Malay holding. Malays are incorrigible fatalists; therefore, if their estates are attacked by some kind of pest or disease, and the most primitive methods fail to produce improvement, they calmly allow the destruction to go on, resignedly declaring it to be the will of God. Consequently it is feared that if things are allowed to continue in this way, pests and diseases which, strangely enough, do not do so much damage to small plantations as to larger ones, will spread from these small Malay estates to the European holdings in the form of practically unconquerable epidemics. Proposals have gone forth to put the matter before the government and urge that a staff of efficient inspectors be organized whose duty it will be to inspect the Malay estates at certain intervals and deal drastically with any cases of disease or pest they may find.

A fire occurred on Malacca Rubber Plantations, Serkam

Estate, on March 29, early in the morning, causing considerable damage to the dry rubber factory. Fortunately there was no wind blowing and the offices and store close by escaped.

SINGAPORE EXPORT DUTIES HAMPER JAPANESE RUBBER INDUSTRY.

According to the "Far Eastern Review," the export duties on Straits rubber shipped through Singapore are likely to prove a heavy blow to Japanese manufacturers. Many factories have already suspended work temporarily because of the situation. Japan's rubber goods industries have been expanding rapidly of late and last year's imports of crude rubber up to November 30 at Yokohama amounted to 2,879,000 yen, as compared to 1,232,000 yen in 1913, rubber to the value of 2,109,000 yen, or 73 per cent coming from Singapore. Of the nation's demand, 9,000,000 yen worth is supplied by domestic goods, while imported articles amount to only about 800,000 yen.

BRAZILIAN NOTES.

MAY 13 was the anniversary of the day upon which the bill for the emancipation of slaves became law. From various parts of the country came reports of more or less brilliant festivities in honor of the occasion.

THE STEVEDORES' STRIKE.

For several days shipping activities at Para were interfered with owing to a strike of the stevedores. Of the many vessels held up at the port, were some waiting to be freighted with rubber for New York and Liverpool. Fortunately this state of affairs was soon brought to an end, thanks to the efforts of the governor, Dr. Lauro Sodré, who worked hard to bring about an understanding between the strikers and the shipping companies. The Lloyd Brasileiro, the Booth S. S. Co. and the Empresa Port of Para were among the companies affected.

A feature of the strike was that the conductors, motormen and chauffeurs threw up their work in sympathy with the stevedores.

RUBBER TRADE CONDITIONS.

Trade during 1916 was very profitable in the states of Amazonas and Maranhao, in the former owing to the high prices ruling in the rubber market. The fall in Brazilian exchange also benefited the exporting centers, Manaus and Maranhao. In spite of this, representative men are of opinion that the prosperity here is purely artificial and that the future is very uncertain. The British vice-consul at Manaus goes so far as to advise British export firms to refrain from extending large or lengthy credits. This is not without significance seeing that the greater part of the exports has up to now been financed by means of letters of credit issued by London bankers and merchants, although considerable amounts have been drawn for on New York in United States currency.

The fact that the output of rubber and caucho ball has remained stationary for some years while the Eastern production has not only increased by leaps and bounds, but has attained a perfection of quality comparable if not surpassing the best Brazilian rubber, is causing uneasiness even among the most optimistic. More scientific methods and the encouragement of planters and *seringueiros* are constantly urged.

The imports of rubber goods, including tires, show an enormous increase in favor of the United States, being 784 per cent in quantity and 554 per cent in f. o. b. value. The increase in quantity, 468,526 kilos, compared with the falling off of 456,720 kilos from Germany, shows that America has successfully replaced the former country in the favor of Brazil.

United Kingdom exports fell off 12.8 per cent in quantity.

Consul George H. Pickerell, at Para, reports that the total exports of crude rubber from Para and Manaus during May,

1917, amounted to 9,219,605 pounds compared with 7,314,826 pounds for the same month in 1916. Shipments to the United States aggregated 7,690,816 pounds and to Europe 1,528,789 pounds, compared with 5,884,222 and 1,430,604 pounds, respectively, last year. There were no shipments from Itacoatira, Brazil.

The several grades of rubber exported are shown in the following table:

Grade.	From Para.		From Manaus.	
	To United States.	To Europe.	To United States.	To Europe.
Fine	1,710,727	565,905	570,082	315,042
Medium	194,820	14,375	125,970	148,587
Coarse	1,220,651	27,118	350,625	13,081
Caucho	2,321,412	136,964	1,196,529	307,717
Totals	5,447,610	744,362	2,243,206	784,427

THE TIRE TRADE OF ARGENTINA.

As a measure to prevent German resumption of the tire supply of Argentina after the war "The Commercial Motor" points out that the *Germans own extensive rubber estates in Para, Brazil, and that it would be to the advantage of British manufacturers to control their sources of rubber supply in a similar manner. While about 75 per cent of the automobiles are of British manufacture and Dunlop and North British tires were well represented, the German Continental tire people were gradually getting the bulk of the trade.

Road conditions in Argentina are improving under the able directorship of British managers of the Argentine railways, many of which have formed a road board and are setting aside regularly 3 per cent of their gross earnings for the improvement and maintenance of the main roads and byways linking the up-country farms with the principal railway depots. Responding to this stimulus, the future trade in pleasure and commercial motor vehicles and accessories of every sort promises to be brisk. It has been predicted that a large measure of South American development will be due to heavy motor lorries, and already there is beginning to be a field for the sturdiest 3 and 5-ton American trucks, our lighter commercial vehicles having failed to stand up under the necessarily hard usage. The dispatch, during the past four years, of no fewer than six American commissions to Argentina, indicates that manufacturers in the United States are not altogether neglecting their trade opportunities with sister republics of the western hemisphere.

BRITISH HONDURAS INCREASES CHICLE EXPORT TAX.

By an ordinance in effect June 16, 1917, the duty on chicle exported from British Honduras is increased from ½ cent to 1½ cents per pound. Statistics for the exports during 1916 have not yet been published in Honduras, but in 1915 there was exported 3,467,696 pounds of chicle gum, valued at \$1,231,655. The imports of chicle gum from British Honduras into the United States during the fiscal year 1916 amounted to 712,288 pounds, valued at \$248,067, while the imports from Canada, which also originate in British Honduras, amounted in the same year to 2,152,933 pounds, valued at \$1,214,963.

RUBBER GOODS IN THE DOMINICAN REPUBLIC.

The total imports of rubber and rubber manufactures of the Dominican Republic amounted to \$58,547 for the year 1916 as compared to \$34,676 for the year 1915. This substantial increase of \$23,871 indicates a growing use of rubber goods in the island republic. Of the 1916 total, goods to the value of \$56,752 came from the United States. Porto Rico was the next largest source, its business amounting to \$1,668.

*Our esteemed contemporary is surely misinformed in this particular.—THE EDITOR.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED JUNE 19, 1917.

- N**O. 1,232,112. Vaginal support. D. G. Carey, Elmira, N. Y.
1,232,113. Billiard cue tip, comprising both hard and soft rubber sections. J. T. Connell, Detroit, Mich.
1,232,182. Demountable rim lock. F. Lindberg, Rice Lake, Wis.
1,232,284. Dental rubber dam holder and cutter. O. B. Elkins and M. S. Smith, assignors of one-fourth to N. Statham—all of Abbeville, Ga.
1,232,290. Life preserver comprising an inflating gas container. B. A. Geiger, Chicago, Ill.
1,232,333. Laminated, cohesive, interwound, bonded fabric for tires. L. A. Subers, East Cleveland, Ohio.
1,232,508. Non-skid device for vehicle tires, comprising a rubber stud. J. E. Peden, New York City, assignor of one-half to T. F. Smith, St. Paul, Minn.
1,232,518. Manufacture of brushes the bristles of which are held by vulcanized rubber. E. E. Robinson, Belleville, N. J., assignor to Hanlon & Goodman Co., New York City.
1,232,545. Means for expanding and contracting demountable rims. J. H. Wagenhorst, Akron, Ohio.
1,232,589. Pencil and pen holder having rubber plugs. J. J. Macnoriuz, Kenosha, Wis.
1,232,606. Quick detachable hose coupling. W. McQuigg Saunders, Evansville, Ind.
1,232,616. Rim and wheel for solid rubber tires. A. C. Stevenson, Scotstoun, Glasgow, Scotland.
1,232,650. Abdominal belt. F. G. Baugatz, Paris, France.
1,232,683. Elastic finger cot for cleaning teeth. J. A. Daly, New Rochelle, N. Y.
1,232,690. Pneumatic cushion. A. C. Eggers, Brooklyn, N. Y., assignor to The Goodyear's India Rubber Glove Manufacturing Co., Naugatuck, Conn.

ISSUED JUNE 26, 1917.

- 1,232,854. Hose coupling. E. F. J. Breuer, Decatur, Ill.
1,232,858. Gas cartridge apparatus for inflating life-preserving belts. W. G. Brokaw, Paris, France.
1,232,902. Tire fastening device. F. P. Johnson, Danville, Pa.
1,232,967. Manufacture of block tires. C. B. Whittelsey, assignor to The Hartford Rubber Works Co.—both of Hartford, Conn.
1,231,025. Self-supporting garment comprising an elastic belt. G. Inghram, Fairview, W. Va.
1,231,141. Fabric for printers' blankets and other purposes. F. E. Ellis, Revere, Mass.
1,231,142. Packing for printing presses. F. E. Ellis, Revere, Mass.
1,231,166. Milking machine teat cup. H. R. Jenkins, Eltham, New Zealand.
1,231,256. Fountain pen. M. E. Heilbrun, New York City.
1,231,296. Resilient heel formed with a suction cup. A. F. Priest, Oak Park, Ill.
1,231,299. Cushion heel for boots and shoes. M. Rieckmann, Springfield, Mass.
1,231,314. Vehicle wheel rim. J. H. Wagenhorst, Akron, Ohio, assignor of two-fifths to The B. F. Goodrich Co., New York City, one-fifth to The Goodyear Tire & Rubber Co., Akron, Ohio, and one-fifth to The United States Tire Co., New York City.
1,231,332. Ankle support and protector. H. J. Collis, Taunton, Mass.
1,231,446. Tire head. W. C. Stevens, assignor to The Firestone Tire & Rubber Co.—both of Akron, Ohio.
1,231,505. Hand stamp. W. J. Denney, assignor of one-half to W. E. Boyer—both of Malone, N. Y.
1,231,530. Valve ball. F. T. Roberts, assignor to The Paramount Rubber Co., both of Cleveland, Ohio.
1,231,538. Vehicle wheel rim. J. H. Wagenhorst, Akron, Ohio.
1,231,539. Vehicle wheel rim. J. H. Wagenhorst, Akron, Ohio, assignor of two-fifths to The B. F. Goodrich Co., New York City, one-fifth to The Goodyear Tire & Rubber Co., Akron, Ohio, and one-fifth to The United States Tire Co., New York City.
1,231,548. Tire valve. E. V. Myers, East Orange, N. J., assignor to A. Schader's Son, Inc., Brooklyn, N. Y.

ISSUED JULY 3, 1917.

- 1,231,568. Electric cable. L. Clark, Englewood, N. J.
1,231,612. Pneumatic tire. O. P. Hoyt, Monroe, N. Y.
1,231,644. Demountable rim. M. F. Patton, Tuscaloosa, Ala.
1,231,748. Teat cup. H. A. Kricke, Crows Landing, Calif.
1,231,777. Cushion pneumatic heel. O. Mussinan, New York City.
1,231,780. Auto wheel having a rim in four sections, each with a solid rubber tire. J. G. Oehler, St. Louis, Mo.
1,231,931. Cushion tire. I. Normandy, St. Catharines, Ontario, Canada.
1,231,957. A pneumatic automobile tire. J. C. Smith, assignor of twenty-four one-hundredths to C. W. Head and twenty-five one-hundredths to B. Garcia—all of Mobile, Ala.
1,232,000. Door stop. F. H. Chave, assignor of one-half to J. W. Talbot—both of Chicago, Ill.

- 1,232,057. Inflatable arm rest for crutches. A. G. Lineback, Falls City, assignor of one-fourth to L. R. Chambers, one-fourth to Ida Davenport and one-fourth to Sarah Lineback, Albany—all in Oregon.
1,232,075. Flexible brush comprising a rubber strip. E. B. Oates, Pater-son, N. J.
1,232,100. Pneumatic tire. O. Schutz, New York City.
1,232,272. Inflation valve cap. C. Frazier and J. Ashmore—both of Biggs, Ill.
1,232,277. Waterproof hat protector. I. Glaser, Washington, D. C.
1,232,292. Rim tool. C. H. Guiles, Addison, N. Y.
1,232,306. Means for securing in place and rendering useful deflated pneu-matic tires. W. H. Heron, Washington, D. C.
1,232,406. Vehicle tire. C. W. Stewart, Martinsburg, W. Va.

ISSUED JULY 10, 1917.

- 1,232,509. Reinforced rubber sole. O. C. Davis, Brockton, Massachusetts.
1,232,518. Rubber heel. E. J. Emery, Port-mouth, N. H.

1,232,726. Pneumatic tire valve. S. C. Sladden, New York City.
1,232,790. Heel. I. Gilbert, Chicago, Ill.
1,232,887. Filler for tires. R. B. Bostwick, Cleveland, Ohio.
1,232,906. Resilient tire. A. M. Ferguson, Rochester, N. Y., assignor to W. Keyel, Penfield, N. Y.
1,232,981. Emergency rim. H. C. Sampson, San Francisco, and A. F. Farman, Oakland both in Calif.
1,233,051. Rubber bumper. P. H. Gundermann, Chicago, Ill.
1,233,143. Cushion tire. A. Teresa, assignor of one-third to M. Prieto and one-third to M. Goizueta—all of Habana, Cuba.
1,233,160. Combined life preserver and diving suit. C. S. Altoonian, Providence, R. I.
1,233,277. Tire. O. A. Kottemann, St. Louis, Mo., assignor of forty-nine one-hundredths to E. A. Holz, C. L. Case, J. C. Holz and J. H. Jones.
1,233,278. Tire. D. A. Messner, assignor of one-third to S. A. Messner—both of Akron, Ohio.
1,233,279. Tire. D. A. Messner, assignor of one-third to S. A. Messner—both of Akron, Ohio.
1,233,283. Vehicle-wheel rim. J. H. Wagenhorst, Akron, Ohio, assignor of one-fifth to The Goodyear Tire & Rubber Co., a corporation of Ohio, one-fifth to The United States Tire Co., and two-fifths to The B. F. Goodrich Co.—both corporations of New York.

THE UNITED KINGDOM.

ISSUED JUNE 6, 1917.

- 105,385. Rubber galvanic batteries. C. C. Rattey, "Logan," Seagry Road, Wainstead, Essex.
105,412. Ply boards or sheets comprising wood veneers and waterproof fabric. S. E. Saunders, White House, East Cowes, Isle of Wight.
105,424. Tire tool. A. A. Friestedt, 2934 West Lake street, Chicago, Illinois, U. S. A.
105,441. Convertible military garment and tent. E. F. Brown, 591a Yonge street, Toronto, Ontario, Canada.
105,459. Rubber-covered vacuum-flask stoppers. F. E. and G. Harris, 40 Sydney street, Stoke Newington, London.
105,473. Game comprising an apparatus with rubber base. J. H. Adams, Rotton Park Road, Edgbaston, Birmingham.

ISSUED JUNE 13, 1917.

- 105,512. Corset having a section of elastic material. D. Kops, 525 West End avenue, Manhattan, New York, U. S. A.
105,537. Wheel comprising a solid tread member and a number of pneu-matic tubes. G. S. Gallagher, 672 St. Nicholas avenue, Man-hattan, New York, U. S. A.
105,577. Seamless hot water bottle. F. C. Jones, 24 Belvedere Road, Upper Norwood, Surrey.
105,684. Detachable rim. H. F. Cox and M. V. Powell, 333 West Ninth street, Flint, and V. F. Brown, North Lincoln avenue, Bay—both in Michigan, U. S. A.

ISSUED JUNE 20, 1917.

- 105,733. Repairing rubber soles and heels. W. Jackson, Patent Fibre Co., of Singapore, Straits Settlements.
105,735. Hot water bottle. F. C. Jones, 24 Belvedere Road, Upper Nor-wood, Surrey.
105,741. Cover for pneumatic tire, comprising tread blocks. C. Jordan, 168 Homeward avenue, Pittsburgh, Pennsylvania, U. S. A.
105,796. Tire casing comprised of rawhide, gutta percha coated, layers of rubber and balata impregnated canvas. A. A. Crozier, 3 Wood-quest avenue, Herne Hill, London.

- 105,843. Helmet comprising rubber tubes. A. F. Bargate, 20 Lawrence Lane, London.
- 105,866. Non-slip bath mat. W. H. E. Clarke, 6102 Market street, Philadelphia, Pennsylvania, U. S. A.

THE DOMINION OF CANADA.

ISSUED MARCH 31, 1917.

- 175,445. Brassiere having an elastic section. B. and H. Prince—both of New York, New York, U. S. A.
- 175,467. Hose coupling comprising fabric hose sections. N. B. Braly, Butte, Montana, U. S. A.
- 175,485. Cord tire. F. S. Dickinson, New York, New York, U. S. A.
- 175,507. Corset comprising an elastic section. D. Kops, New York, New York, U. S. A.
- 175,581. A tire having an outer and an inner section made of tough flexible material, and an intermediate section of soft rubber. The Pearce-Arrow Tire & Rubber Manufacturing Co., assignee of A. L. Pearce—both of Philadelphia, Pennsylvania, U. S. A.
- 175,604. Heel pad for boots and shoes. J. A. Adams, assignor, Toronto, and E. A. Adams, assignee of all the title, Montreal, Quebec.
- 175,613. Tire protector. W. E. Wilson and S. S. Wilson—both of Des Moines, Iowa, U. S. A.
- 175,629. Life preserver. W. Bruce, Walla Walla, Washington, U. S. A.
- 175,631. A container for a stack of tires. W. R. Busenbark, Akron, Ohio, U. S. A.
- 175,648. Tire shoe. J. C. Fickes, Steubenville, Ohio, U. S. A.
- 175,666. Truss comprising a rubber pad. D. McKay, Collingwood, Ontario.
- 175,679. Air cooled pneumatic tire. I. Normandy, St. Catharines, Ontario.
- 175,688. Block tire. C. A. Simons, Albany, New York, U. S. A.
- 175,758. Pneumatic tire pressure gage. C. Harrison and K. Lamond—both of Vancouver, British Columbia.
- 175,953. Pneumatic tire armor. J. I. Kent, Dundas, Ontario.
- 175,966. Catamenial support. W. K. Lyall, Montreal.
- 175,987. Tennis ball. F. W. Stockton, Chicago, Illinois, U. S. A.

NEW ZEALAND.

ISSUED MAY 17, 1917.

Review of the Crude Rubber Market.

Copyright 1917.

NEW YORK.

THE crude rubber market has been dull in a general way throughout the entire month; however, in some quarters a fairly active business was reported. This fairly reflects the condition of the rubber mills, many of which are running night and day on war orders, while others have slowed down for repairs and inventories usual at this time. As a whole, the rubber industry is unusually busy, with government business as the prime mover.

The interest of manufacturers was almost entirely confined to inquiries for the various positions in 1918 and the actual volume of business transacted in futures was undoubtedly small. The fact is, producers are not at all anxious to quote or sell futures, due to the difficulties that encompass shipping and the uncertainties of ocean freight rates. There are, moreover, other reasons; for instance, producers are confronted with war taxes that will be increased and to what extent no one knows, as the war pressure grows heavier. Overhead costs, price of exchange, packing and handling charges may also be augmented through unforeseen circumstances and the burden will fall on the producer who would be forced to fill his "future" contracts at a loss.

Prices for spot plantation grades were steady and small price changes recorded during the early part of the month, when later, following the upward swing in London, the local market became firmer and prices advanced.

On July 5 First latex crêpe and Smoked sheet ribbed was 67 cents for spot and nearby. October-December, 66 cents; January-June, 65½ cents, and January-December, 65 cents. Brazilian sorts were devoid of interest, Upriver fine being quoted 69 cents. The tendency of the market was downward as the month progressed and with minor fluctuations obeying dominant London, prices were practically unchanged as the last week of July was brought to a close. On July 28, First latex crêpe spot was quoted 67½ cents, Smoked sheets ribbed, 67 cents, while futures for both grades for all positions, including next year, were 67 cents. Brazilian sorts were dull with Upriver fine at 68½ cents.

LONDON.

A fair demand and sufficient supplies were the reasons for the firm conditions that have ruled the London market during the past month. The consuming interests have been content with supplying their immediate requirements from available stocks at ruling spot prices but have not been attracted to any great extent by the present future offerings. The consumers are waiting for lower prices, supported by the promise of a heavy crop next year, while the producers, faced with uncertainties attending production costs, are unwilling to sell too far ahead.

Standard crêpe spot was selling on July 5 at 30d. and Smoked sheets at 29¾d. August-September was quoted 31d. and October-December 32d. Fine hard Para spot was quiet at 36d. The market continued steady, with firm prices and minor changes in value, until the end of the month. On July 28, Standard crêpe was quoted 30¾d. and Smoked sheet 30½d.

London and Liverpool imports for May were 6,700 tons compared with 10,000 tons for April. Reexports for May were 6,093 tons against 8,200 tons for April.

SINGAPORE.

There has been little demand during the month of July in the Singapore market and price values have steadily shown a downward tendency. At the auctions held June 29, July 7, 13 and 20, the average prices realized were as follows: First

latex crêpe, 56.09 cents, compared to 59.7 cents a month ago. Smoked sheets ribbed, 55.14 cents, compared to 60.19 cents last month. The total amount sold was 1,628 tons, compared to 1,549 tons sold a month ago.

COMPARATIVE NEW YORK PRICES FOR JULY.

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York), advises as follows:

"During July the market for commercial paper has been very uncertain, most banks being in the market only occasionally off and on, and rates have been 5@5½ per cent on the best rubber names and 6@6½ per cent for those not so well known."

	Standard Crêpe	Ribbed Smoked Sheets.	Market.
June 25	29¾d.	29d.	Dull
July 2	29½d.	29¼d.	Steady
July 9	30d.	29½d.	Steady
July 16	30d.	30½d.	Firm
July 23	31d.	31½d.	Firm

WEEKLY RUBBER REPORT.

GUTHRIE & CO., LIMITED, Singapore, report [June 1, 1917]:

The weekly rubber auction opened yesterday with a good demand for high-grade rubber, fine pale crêpe selling up to \$152, and ribbed smoked sheet to \$150 per picul. At the continuation of the sale today the demand was maintained, one lot of ribbed smoked sheet fetching \$151 per picul. The top price for fine pale crêpe is the same as last week's, and that for ribbed smoked sheet is \$1 down. For palish, brown and dark crêpes there was a brisk demand at relatively good prices, but inferior lots of smoked sheet were neglected, and a considerable quantity was brought in. Unsmoked sheet met with a moderate demand, at about last week's prices. Of 800 tons cataloged, 453 tons were sold.

The following was the course of values:

	In Singapore per Picul.*	Sterling Equivalent per Pound in London.	Equivalent per Pound in Cents.
Sheet, fine ribbed smoked,	\$145@151	2/11 @ 3/ ¼	61.62@64.17
Sheet, good ribbed smoked,	130@145	2/ 7¾ @ 2/11	55.25@61.62
Sheet, plain smoked,	120@129	2/ 5¾ @ 2/ 7¾	51.00@54.82
Sheet, ribbed unsmoked,	118@132	2/ 5¼ @ 2/ 8¼	50.15@56.10
Sheet, plain unsmoked,	115@125	2/ 4¾ @ 2/ 6¾	48.87@53.12
Crêpe, fine pale,	149@152	2/11¾ @ 3/ ¾	63.32@64.60
Crêpe, good pale,	137@149	2/ 9¼ @ 2/11¾	58.22@63.32
Crêpe, fine brown,	131@140	2/ 8 @ 2/ 8¾	55.67@59.50
Crêpe, good brown,	120@130	2/ 5¾ @ 2/ 7¾	51.00@55.25
Crêpe, dark,	100@121	2/ 1½ @ 2/ 5¾	42.50@51.42
Crêpe, bark,	68@104	1/ 6¾ @ 2/ 2¾	28.90@44.20
Scrap, virgin and pressed,	60@ 92	1/ 5½ @ 1/11¾	25.50@39.10
Scrap, loose,	80@ 81	1/ 9¼ @ 1/ 9½	34.00@34.42

* Picul = 133¼ pounds.

Quoted in S. S. dollars = 2/4 [56.7 cents].

STRAITS SETTLEMENTS RUBBER EXPORTS.

The export of plantation rubber from Straits Settlements ports in the month of May, as officially reported by cablegram from Singapore, amounted to 6,282 tons. Of this total, 928 tons were transshipments from adjacent countries. Appended are the comparative statistics for three years:

	1915.	1916.	1917.
January	2,576	4,443	3,562
February	2,741	3,359	6,495
March	2,477	4,481	8,299
April	1,978	4,219	6,103
May	3,588	3,274	6,282
Totals	13,360	19,776	30,741

The above figures include transshipments of rubber from various places in the neighborhood of the Straits Settlements, such as Borneo, Java, Sumatra and the Malay States other than the Federated Malay States.

FEDERATED MALAY STATES RUBBER EXPORTS.

It is officially reported from Kuala Lumpur that the exports of plantation rubber from the Federated Malay States in the month of June amounted to 6,008 tons, which compares with 7,179 tons in May and 5,114 tons in the corresponding month last year. For the first half of the present year, the exports amounted to 39,471 tons compared with 27,091 tons in 1916 and 19,190 tons in 1915. Appended are the comparative statistics:

	1915.	1916.	1917.
January	3,473	4,471	5,995
February	3,411	5,207	7,250
March	3,418	4,429	7,084
April	2,777	3,914	5,955
May	2,708	3,956	7,179
June	3,403	5,114	6,008
Totals	19,190	27,091	39,471

EXPORTS OF CEYLON GROWN RUBBER.

(From January 1 to May 28, 1917. Compiled by the Ceylon Chamber of Commerce.)

To	1917.	1916.
United Kingdom	12,999,165	7,721,711
France	1,322,371	586,650
Italy	33,600	
Russia	177,623	179,010
Western Australia		56
South Australia	27	
Victoria	198,353	336,016
New South Wales	61,858	63,776
United States	7,161,914	11,594,584
Canada and Newfoundland	239,694	2,240
India	25	600
Japan	26,848	94,676
Totals	22,221,478	20,579,319

(Same period 1915, 17,077,193 pounds; same period 1914, 13,167,984 pounds.) The export figures of rubber, given in the above table for 1914, include the imports reexported. (These amount to 1,641,720—1,364,436 pounds from the Straits, and 265,660 pounds from India.) To arrive at the total quantity of Ceylon rubber exported for that year deduct these imports from the total exports. The figures for 1916 and 1917 are for Ceylon rubber only.

THE MARKET FOR RUBBER SCRAP.

Copyright 1917

NEW YORK.

THE rubber scrap market developed a pronounced weakness during the latter part of June that continued into the first week of the month just passed when all grades shared in the general downward movement. The absence of actual buying during the entire month has failed to support the sagging mar-

ket and the amount of real business reported was confined to contract deliveries and small lot orders. In spite of the dull market conditions values have been supported in a manner that shows confidence in the future. With crude rubber at unusually low prices the demand for scrap and reclaim will naturally be curtailed, however with the rubber mills busy on war orders and reclaim moving freely there is hope not long deferred for better conditions in the rubber scrap market.

BOOTS AND SHOES. The market for this material has been generally inactive although some transactions have been reported that would indicate at least a passing interest in boots and shoes. Prices for delivered lots are said to be 9½ cents, but reclaimers persist in offering 9¾ cents. Trimmed arctics have failed in interest at 7¾ cents and untrimmed are nominal at 6¾ cents. The hope of the boot and shoe situation is based on the large war orders that the rubber mills are working on to meet government requirements.

TIRES. The tire situation has been affected by the ruling sluggish conditions that are in a measure seasonable and expected in the trade. White G. & G. tires have been shown very little interest, and the mixed tire business transacted during the month has been almost negligible. Prices are ½ to ¼ cent lower than our quotations last month. However solid and bicycle tires have experienced a fair demand at firm prices.

INNER TUBES. This material appears to have been entirely neglected with the exception of small lot orders. Inner tubes free from patches and valve seats is a new grade provided for in the new rubber specifications.

MECHANICALS. There has been practically no movement in mechanicals last month, and prices, with few exceptions, have not changed.

LONDON AND LIVERPOOL STATISTICS. The London and Liverpool imports of waste and reclaimed rubber for May were 143,600 pounds, compared to 167,300 pounds for April. Reexports for May were 65,200 against 22,300 for April. Exports of waste and reclaimed rubber manufactures of the United Kingdom for May were 904,100 pounds, against 1,062,300 pounds for April.

NEW YORK QUOTATIONS FOR CARLOAD LOTS DELIVERED.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

Copyright 1917.

NEW YORK.

JULY has been a dull month in the base metal market, with the uncertainty of the government's final policy as the chief disturbing factor. Should the one-price-to-all plan be adopted, present market values will undoubtedly experience radical changes. Under the present conditions it would be daring to buy except for immediate requirements. The leading producers have temporarily withdrawn from the market. Lead has been generally weak with prices showing a downward tendency, until the last week of the month when the market stiffened somewhat. That the government will soon require large quantities of this metal is firmly believed in trade centers. Spelter has shown weakness and prices have declined during the month, due to the question of government requirements and price regulations. Metal antimony has weakened in the face of small demand and prices have consequently declined. Aluminum has had but little call last month and prices are lower, No. 1 virgin metal, 98 to 99 per cent pure, being quoted 53 to 55 cents on July 25.

Business in rubber materials has been good for the month just passed. The volume of supply, while far from normal, has appeared to equal the demand. The market has not been affected by the periodic summer dullness, but on the contrary, conditions are brisk and buying active. The report that government specifications for inner tubes and airplane hose will include antimony sulphuret and heavy calcined magnesias has strengthened the market for these materials.

ACETONE. A steady demand and increased cost to producers has marked up the price of acetone about 3 cents a pound.

ALUMINUM FLAKE. Business has been good and deliveries on contracts regularly called for. Prices are unchanged and firm.

ANTIMONY SULPHURETS. The buying in this material has been quite active, and consumers have been freely anticipating their future requirements. Prices are the same as a month ago and market conditions firm.

CARBON BISULPHIDE. The call has been so insistent that some dealers are entirely sold up. Prices have advanced and 7 to 7½ cents are the present quotations.

CARNAUBA WAX. This has been requisitioned by the British Government, all stocks over two tons have been seized and no further dealings in this material will be permitted without a license.

DRY COLORS. Active demand has featured the color market. Bright red oxide, ultramarine and cobalt blue have received particular attention from consumers. Prices are firm and show an upward tendency.

LEAD PIGMENTS. These have been steady and unchanged by the lower prices of pig lead. Producers are waiting the government's decision as to quantity required and price to be paid.

LITHOPONE. The market has been quiet, with consumers asking for contract deliveries without reserve. Prices are firm but unchanged.

RECLAIMED RUBBER. The call for supplies of this material has been urgent from all quarters, with the question of delivery taking precedence over price. Prospects are good for continued activity in this market for the balance of the year.

WHITING. The market continues strong, due to the fact that producers are entirely sold up. There is no tangible relief in sight and until the difficulties that prevent the arrival of the raw materials are removed there will be no change for the better.

ZINC OXIDE. While the demand for spot zinc oxide has been active, actual trading has been light, due to the high prices asked by holders of second-hand stocks and the reluctance on the part of consumers to pay 16 to 18 cents for spot zinc oxide. Contract deliveries have been regularly called for by the rubber trade.

THE MARKET FOR COTTON AND OTHER FABRICS.

Copyright 1917.

NEW YORK.

DURING the last week in June the apprehension of a short crop of American cotton was increased by report of drought in the producing centers and resulted in all deliveries being marked up to or above the 27-cent level. These high record figures caused considerable liquidation without materially disturbing the market, but the publication of the government's crop report on July 2, forecasting a better crop condition than was anticipated, broke the market and active selling ensued. On July 5 spot cotton was quoted 25.45 cents and October deliveries were 24.53 cents. The government figures indicate a yield of 11,633,000 bales, excluding linters, compared to 11,449,930 bales, the actual production of last season. As the month progressed, reports of beneficial showers in the South gave strength to the market and prices rallied; however, irregularity and frequent fluctuations were marked features. On July 25 spot middling cotton was 25.65 cents with October futures around 23.82 cents.

According to preliminary statistics compiled by the Bureau

of Census, the amount of cotton consumed in June, 1917, was 575,122 bales, compared with 570,597 bales for the corresponding month in 1916. Cotton on hand in consuming establishments on June 30 was 1,749,738 bales against 1,835,089 bales for the same date last year, and the amount in public storage and at compresses was 1,406,821 and 1,520,370 bales, respectively.

EGYPTIAN COTTON. Nothing definite has occurred to relieve the Egyptian cotton situation occasioned by the British embargo. This season's crop has been disappointing in quantity, 120,731 bales being imported into the United States from August 1, 1916, to June 20, 1917, compared to 192,795 bales for the same period last year. The progress of the new crop which will come on the market in the next two months is not encouraging, although it is too early to forecast accurately, as the crop is made or marred in August and September. It is confidently expected that by the time the new crop is ready for shipment ample shipping arrangements will have been made, either by lifting the embargo or by the establishment of a direct service between Alexandria and this country. This question is of greatest importance to the rubber industry as it is estimated that 80 per cent of the Egyptian cotton imports is consumed by the tire trade.

SEA ISLAND COTTON. The southern markets are closed for the season as the old crop has been marketed and sold. There has been an increase in the acreage of Islands planted this year and in consequence estimates for the coming crop range from 8,000 to 10,000 bales, while the Georgia and Florida acreage has increased from 10 to 30 per cent. The crop, taken as a whole, is doing fairly well, although two or three weeks late. The appearance of boll weevil in certain sections has caused some apprehensions; the final result, however, will be dependent on weather conditions during the next two or three months and, if favorable, there is reason to expect a crop equal to that of last year.

AIRPLANE FABRICS. The market has been featured by a steady call during the past month for both No. 1 40-inch and No. 4 38½-inch balloon fabrics. The scarcity of Egyptian cotton has seriously complicated the situation, with the result that long staple American is being substituted.

HOSE AND BELTING DUCK. Government requirements are crowding the mills to full capacity, and business has been most active. There seems to be no diminution in the civilian demand, unusual at this time of the year, for mechanical fabrics, as the trade appears to be laying in stocks of manufactured goods in anticipation of future requirements.

RAINCOAT FABRICS. The local market is very active, the demand for 64-60 Bombazine being particularly heavy due to government orders, and all raincoat makers are extremely busy on war contracts. Civilian business is practically at a standstill.

SHEETINGS, DRILLS, OSNABURGS. Government business is the cause of the unprecedented activity prevailing in this market. The civilian call for all grades continues unabated, a most unusual condition for the summer season. The fabric mills show no signs of slowing down and are well sold up into March of next year.

TIRE FABRICS. The tire fabric market is dominated by the Egyptian cotton situation occasioned by the embargo. If sufficient supply of the raw material is permitted to reach this country within the next two months, the trade will not suffer. Meanwhile, consumers are quietly experimenting with long staple American grades as possible substitutes should the usual supply of Egyptian cotton be unavailable.

The anticipation that the government would require a large part of the capacity of the tire fabric mills has not been realized. It was found inexpedient and too costly to operate tire fabric looms on the coarse product required by the government. In the absence of government business the tire fabric market has been quiet and a perceptible easiness in deliveries noticed during the past month. Prices have been generally firm and

standard Egyptian building fabric, combed and carded, has advanced since our last report, due to the strong position of the raw material.

NEW YORK QUOTATIONS.

TABLE OF CONTENTS ON LAST PAGE OF READING.**THAT TIRED FEELING.**

INDUSTRIAL fatigue in factory workers has been investigated very thoroughly in the last few years and the results should be of the greatest value to manufacturers. Leading investigators have been Professor A. F. Stanley Kent, M. A., D. Sc., of the University of Bristol, England; Professor Ernest G. Martin, Leland Stanford University; Professor Lombard, University of Michigan, together with French and Italian scientists. The tests prove, briefly, that overtime reduces production, that eight hours' labor produces more than twelve hours, and that Sunday work cuts down production. It is only fair to state that most of the great American factories are operated on eight-hour shifts, and that there is no Sunday work. There are still some factories that believe in long hours and bet on overtime, but they are growing beautifully less as time goes on, not from philanthropic but from business reasons.

PROFITEERING MUST CEASE.

THE indications that certain American producers will, apparently, fight the plans of the War Industries Board to have them sell war supplies to the allied governments at the same prices charged the United States set one to wondering what sort of American citizens such men can be—not patriots surely. America entered the war with noble purpose and in the spirit of an humanitarian duty to perform; every good citizen shared that opinion. The whole people is tired of price extortion at home, and now that the Allied cause is ours also the feeling of the majority regarding profiteering on war supplies going overseas has undergone a distinct change.

President Wilson voiced popular sentiment in a recent address when he said: "Patriotism leaves profits out of the question. In these days of our supreme trial, when we are sending hundreds of thousands of our young men across the seas to serve a great cause, no true man who stays behind to work for them and sustain them by his labor will ask himself what he is personally going to make out of that labor."

No argument should be necessary on the principle that as there is now a common purpose among the nations fighting for world democracy, and since the Allies are buying their supplies with American money, justice requires that costs be equalized. Reasonable profits sufficient to sustain American industry must be assured, but exorbitant profits all out of proportion to the cost of production cannot longer be tolerated.

Evidence accumulates to indicate that the war is quite as likely to be brought to a close by the economic collapse of Germany as by an Allied victory on the battlefield. America is already heavily financing the Allied nations, and in conserving their economic strength she conserves her own and hastens the coming of peace. Fair prices must obtain even though government price regulation and further legislation have to be resorted to in order to accomplish the desired end. Happily no act of the rubber industry has given cause to believe such extreme measures will become necessary. May other lines of manufacture emulate its unselfish example.

CORD TIRES UNDER FIRE.

IT has been demonstrated that pneumatic tires are not likely to be punctured by flying bullets, and that their use is practical for officers' and other light military cars when under fire. Cord tires running at the rate of ten miles an hour were subjected to rifle fire at 50 yards. Eleven shots struck, but either failed to enter the tires, followed the fabric to the rim and there emerged, or remained between rubber and fabric or between rim and inner tube. In no instance was the tube punctured, although a twelfth shot, fired squarely into the tread with the wheel standing still perforated casing, inner tube, rim, three-eighths-inch iron felly and shattered itself on the iron protecting plate of the wheel.

The result is attributable to the movement of the wheel, the deflecting angles at which the shots were fired, and the resiliency and flexibility of cord tire construction. Henceforth, the speed maniac will cease to fear the town constable who commands him to stop or have his tires decorated like a Swiss cheese.

THE CALL FOR TRAINED RUBBER CHEMISTS.

IN rubber, as in every other manufacturing business, the call is now for the man who knows. Chemistry is the common foundation of all great commercial industries. The time is past when industrial chemists were regarded as mere drug clerks; their achievements in applied science have won for them a full appreciation of their value to the community. Already they hold high government positions, become officers in the army and navy, and directors of great manufacturing companies. Everywhere they have demonstrated the tremendous earning power of chemical research and scientific control which increase production, utilize waste, devise improved methods and invent new products.

Twenty years ago a chemist with difficulty obtained employment in a rubber mill, and only within a very few years have rubber chemists been accorded the recognition they deserve. But the progress they have made during the past year in accelerators alone demonstrates the value of specialization and makes it certain that rubber manufacturers will lean upon them heavily in future. There is still much to be learned about this subject, about vulcanization, coagulants for rubber latex, accelerated aging tests, rubber compounds for special purposes, and many other important matters which rubber chemists must be depended upon to discover. Indeed, every rubber manufacturer now has his chemist, and several of the larger firms maintain research laboratories manned by a large corps of trained experts.

It is an encouraging sign of the times that men are being specially educated for such work in several lines. As has long been the case in Germany, the technical schools of America are at last awakening to our needs in applied science and beginning to cooperate with leading industries with an enthusiasm that promises splendid future results. At the Massachusetts Institute of Technology a new plan for cooperative education and research which is far reaching in scope has been put into operation. A five-year course in chemical engineering leading to an advanced degree has been inaugurated in connection with a School of Chemical Engineering Practice. At the plants of five large manufacturing companies, representing widely different fields of chemical engineering activity, the institute maintains a well-equipped station for instruction and research. Thus each company provides its plant as a working chemical engineering laboratory

for instructional purposes and the institute reciprocates with a research organization devoted exclusively to the specific needs of the company. In this manner a real cooperation for a common good is attained; the factory experience is invaluable to students, while the research facilities of the institute greatly benefit the company in solving its manifold technical problems. Such a combination of fundamental science with its immediate application cannot fail to produce the sort of men that rubber and other industries will henceforth find themselves much in need of. It is to be hoped that this course will soon embrace the rubber industry.

THE RUBBER SECTION MEETING AT BOSTON.

RUBBER chemists are busy as never before. They have many problems of common interest to solve quickly and well, and appreciate the need of discussion and comparison of ideas. The program for the annual meeting of the Rubber Section of the American Chemical Society at Boston early in September has been arranged with these thoughts in mind, and all indications point to an exceptionally large gathering of leading chemists from all sections of the country seeking the benefit of common council for their country and their companies.

THE GREAT PATRIOTIC BUSINESS CONVENTION.

THE great business convention to be held at Atlantic City, September 17-21, under the auspices of the Chamber of Commerce of the United States, promises to be the most notable gathering of commercial leaders that this country has ever seen.

How business, big and little, can come to the help of the country and of the world is what the convention will try to find out. It is a fine, practical conception and will result in great good.

WHAT FIRE ELIMINATION MIGHT ACCOMPLISH.

BECAUSE of the importance and variety of rubber goods among war munitions, fire precautions in rubber mills, as in other essential factories, will receive more than customary attention. What fire elimination might accomplish is quickly shown by government statistics. During the past ten calendar years fire losses in the United States have aggregated approximately \$2,000,000,000, the amount of the first Liberty Loan. The booklet, "Safeguarding Industry," with its directions for the prevention of fire, which has been issued by the National Board of Fire Underwriters with the indorsement of President Wilson, therefore deserves the thoughtful perusal of every manufacturer in rubber and allied lines. It emphasizes and illustrates the words of the President to the effect that "preventable fire is more than a private misfortune; it is a public dereliction."

What I Saw in the Philippines—III.

By the Editor of The India Rubber World.

Leaving Manila for the South—The Governor of Mindanao—On Board a Revenue Cutter—Sleeping, Eating and Living on Deck—The Beautiful Philippine Inland Sea—A Bit About Mindoro—The Chicago Plantation—Opon and Its Great Oil Factory—Dean Worcester at Home—Cebu—Visit from a German Propagandist—Visayan Laborers Board the Cutter—Something About This Type of Labor.

THIS being primarily a story of rubber hunting I shall, perhaps, be pardoned for postponing descriptions of Manila, Baguio *et al.*, as well as my thrilling adventures with calesas, carabaos, carromatas and other indigenous dangers. Nevertheless, I intend to return to them, for they should be chronicled for the benefit of those who follow.

The rubber lands of the Philippines really lie far to the south of Luzon, centering in and about the great island of Mindanao. I had long been in touch with a newspaper man in Zamboanga, the capital of that island, and through him had conceived a vast respect for Governor Carpenter, the present civil ruler. When, therefore, an influential American arranged for me to meet the governor, who was then in Manila, I was delighted. The meeting resulted in an invitation on the part of his excellency to visit the Southern Islands and to go on the revenue cutter "Mindanao," sailing the day following. I should say in explanation that the journey is a long one and rather difficult to negotiate. It is, of course, by water, the usual means of conveyance being the small inter-island boats that run at irregular intervals, and that are crowded with natives and freight to a degree that must be seen to be appreciated. There are, to be sure, the government transports, but unless one is in government service they are not available. Governor Carpenter's invitation was, therefore, eagerly accepted.

It was midnight when we went aboard, and within an hour we were quietly steaming out of the harbor and headed south. Even if it was a governor's boat it was crowded.

LEAVING THE HARBOR.

Six of us shared one tiny stateroom; not to sleep in, however. It was simply a dressing room, from which, pajama-clad, we emerged, climbed to the main deck and bestowed ourselves on cots. Of the six were a young architect from Boston in charge of Philippine public buildings, a lieutenant of constabulary on his way to Tawi-tawi, the superintendent of schools of Mindanao, and two Davao planters.

It was cool and comfortable on the windswept deck, and one clutched the blanket tight and slept, awakening every now and then to grab the clothes that the breeze had almost succeeded in blowing away.

Breakfast was served on the after deck at a long table at one end of which sat the governor, and at the other the alert captain of the steamer, while between were the passengers or guests, seven Americans, a couple of native priests and several Filipino officials. It was a very friendly and jolly company, and the fare, prepared and served by Chinese stewards, was excellent.

The captain was a young, athletic Californian, the only American left in inter-island service, and he was without

exception the most expert handler of a steam vessel that I have ever seen. When others would stop 50 feet from a pier and warp in, he ran boldly in, set the boat's nose against the quay so gently that the shock would not crack an egg, and then swung into place without bump or splash. Or if a native boat was in his berth, he slipped in and gently but firmly edged it away.

Breakfast over, the panorama of sea and shore was enthralling. I have traversed Japan's "Inland

GOVERNOR CARPENTER AND SULTAN OF SULU IN FRONT OF GOVERNMENT BUILDING, ZAMBOANGA.

Sea" by day and by night several times, and freely concede its beauties, but after three trips through the inland sea of the Philippine Islands, I think the latter by far the more beautiful. The climate is such that one's time is spent on deck; indeed, in all of the small steamers, staterooms, though furnished with berths, are used only for dressing; all sleep, eat and live in the open.

The islands, big and little, are forest clad to the tops. Passing between them in bright sunlight over a sea rippled by gentle breezes, close to cloud-capped shores, glimpsing native settlements of Nipa houses, meeting fleets of fishing boats with their double bamboo outriggers, watching for and seeing flying fish, porpoises and an occasional huge sea turtle, interest is ever kept alive.

After leaving Manila and coasting down by the provinces of Cavite and Batangas, it is a good 12 hours to the entrance of the long Verde Island Passage between Luzon and the great forested island of Mindoro. Possibly the boat stops at the little cement pier at Calapan to send telegrams. If so, the picture of the native town fringing the shore of the great shallow bay is one not soon to be forgotten. Indeed, few see even as much as this of this sparsely settled island. If one really visits the island for scenery or sport, he takes a boat from Manila to Port Galera, which will some day be a show place of the islands. The

PARA SEEDLINGS, "CHICAGO" PLANTATION, MINDORO.

VIEW OF "CHICAGO" HEADQUARTERS, MINDORO.

scenery is marvelous, both on shore and beneath the waters of the crystal-clear sea. Here a glass-bottomed boat would disclose marine growths and brilliantly tinted fishes that far outclass those of the Bermudas or the Hawaiian Islands. There are no hotels, not even rest houses, but safe camping places and excellent sea bathing. This island is noted as the home of the timarao, a small and exceedingly wild carabao. It is sometimes killed by big-game hunters, and is a sport fully as arduous and dangerous as tiger hunting.

For those interested in rubber, it is a bit of a surprise to know that on this island, only 100 miles from Manila, is a *Hevea* plantation some six years old. It is situated but a few miles from Calapan, and is locally known as "Chicago." At the time of its beginnings the Americans in charge had little

money and no experience in rubber planting. They sowed the seeds thickly in rows, and let them come up as planted. The result was a growth that looked like bamboo, so tall and slender were the trees. Later, when they desired really to give them a chance, the experts said they were too large for transplanting. The head of the agricultural department in Manila, however,

advised digging trenches along the rows, to preserve laterals, and cutting off all but about two feet of the tap roots. This was done, and every tree not only lived, but grew amazingly. Some 3,000 were thus treated, and they are now ready to tap and apparently as well off as they could be in any part of the world.

A curious fact about this plantation is that it is so far untouched by typhoons, and likely to con-

tinue safe. This is undoubtedly due to its being in the shadow of Mt. Halcon and the range that it dominates, which form a very effective wind-break.

I met one of the owners of "Chicago" at the Golf Club at Calocan. He is an attorney in Manila, and was not at all sure as to what the future of the plantation would be, as it seemed to him that so far Americans had taken but little interest in Philippine rubber. Should such interest develop he saw a future in it as a seed producer for those who planted, say in Mindanao. As the trees have already begun to seed abundantly, this is very far from being a dream.

An American friend long resident in the Philippines, and one who thoroughly believes in the future of *Hevea* there, was almost absurdly chagrined over this plantation. Said he:

"I wish a typhoon would wipe it out today! The danger is that this, which is really in the typhoon belt, because of its wind-break, will not be harmed. Taking it as an example, enthusiastic Americans will rush plantings into other places in the zone of big winds, where there are no barriers, and have their whole planting destroyed. Then they and others will

REPLANTED SEEDLINGS, "CHICAGO" PLANTATION, MINDORO.

claim that rubber cannot be safely grown here. Until rubber growing on a big scale is an accomplished fact, plantings in sections that are not ideal should be prohibited."

Curiously enough the nearer one gets to the country said to be swept by big winds, the less one hears of their alleged

destructiveness, and as for signs of destruction, they do not appear to be in evidence.

All day long and all of the night following we steamed through straits, sounds, seas, bays and bodies of water big and little, by islands tiny and huge, until we began to realize what the geographers meant when they said there were really more than 3,000 islands in the Philippines. Finally, on the afternoon of the second day, we passed through a narrow, picturesque strait between the islands Mactan and Cebu. On the first named is the modern plant of the Visayan Refining Co., a big coconut oil mill installed by Dean C. Worcester. Strung along the shore are, first, the great oil factory, with its storage tanks and the bungalows of the resident officers, and, separated from plant and bungalows by a tiny creek, the village of Opon. This last named consists of one long street bordered by Nipa huts terminating in a plaza with market, ancient cathedral and a flourishing native school.

In visiting the plant one is impressed by the industry and alertness of the native workman. Only the chiefs of departments are Americans, the mass of workmen being Filipinos. In the village the people look healthy, well fed and contented, and show themselves to be exceedingly courteous. The great factory itself is the last word in intelligent equipment and arrangement for economical and efficient production.

Dean Worcester's house is, perhaps, the most roomy and best designed tropical house in existence. Situated so that the monsoons can sweep through every room, with broad verandas completely encircling it, finished in beautiful native woods, it is simple, homelike and elegant. Nor is it cluttered and cluttered with trite curios. There are a few rare ones, but each has

inspiring. Tropical nature has indeed favored this lovely spot.

The most picturesque and interesting feature, however, is the head of the home. As one who was in "at the beginning," who hob-nobbed with head hunters, traveled where white men had never gone before, organizing, pacifying, botanizing, observing, he is one of the commanding figures in that part of the world. The most marvelous part of his career, however, is that, dropping state work, he should enter the field of manufacture and install successfully a great industry among alien, and to a degree hostile, people, and do it to their benefit and his.

It is some seven miles from Dean Worcester's plant to the city of Cebu on the great island of Cebu. This city is noted as being one of the oldest in the islands. It looks even older than that. We were hardly fast to the big stone quay—American made—when a young German came aboard with a word of introduction wired by friends in Manila. He was interested in a rubber plantation further south, and told me all about it, how to reach it and so on. While we were chatting one of the Americans strolled up and stood looking intently and I thought eying him very searchingly. Later, the German having departed, the American said,

"Did X say why he took such long journeys into the interior from time to time?"

"No, what's the answer," I replied.

"I don't know yet, but it will all come out in time."

And it did. With the declaration of war by the United States the young German was at once locked up. It seems he had lists of former insurrectos and had been visiting them secretly, giving them \$5 a head and arranging for a general rising against the Americans. The insurrectos accepted the cash and were profuse

TYPICAL NATIVE VILLAGE WATERFRONT.

DEAN WORCESTER'S GREAT OIL MILL AT OPON.

either some definite use or a historic or intrinsic value that earns it a place in such a home.

The situation of the house is such that in any direction there stretches a panorama of sea, shore, coconut grove, native village and picturesque mountain. Added to this are cloud effects seldom equaled, which, with the brilliant blues and greens in the waterways, make a whole that is ever changing and always

in promises, but when the time came not one insurrected. Nevertheless, the American men resident there who had entertained him at their homes, and admitted him to their clubs will not soon forget that he tried to bring about destruction of their property and perhaps a massacre of their wives and children.

I had heard so much of the impossibility of getting laborers in the Philippines that when some 70 jolly, tough little Visayans

swarmed aboard at Cebu and overran all of the lower deck, I began to ask questions.

"Good workers? Sure," said the planter to whom they were consigned. "Better than Chinamen. We pay their passage down and they work, say, for a season or for a year, and then go home. In that lot are 20 old hands. The rest are new recruits. Labor scarce? I should worry! Aren't we shipping lots of these same Visayans to Hawaii to work on the sugar plantations there?"

"Do you have trouble with them?" I asked.

"Some. That little clerical-looking chap out is an agitator. He is from Manila and is down here to start trouble. When we come to my pier he will make impassioned speeches and try to get the men on a strike. His stunt will be to yell, 'You have been deceived! Do not get off the boat.' It will appeal to some of them, but my 20 old hands, who want the work and who know they are well treated, will

pull the other way and we don't lose many of them, if any."

The laborers are easily managed, but are very like children, and the employer needs to be not only just, but tactful and exceedingly patient.

FILIPINO FISHING BOAT.

lengthy descriptions of symptoms. During this recital the uncovering of the wound is abandoned, for one must perforce use convincing and appropriate gestures. Then, too, the narrator becomes so enthralled with his tale of suffering that he forgets the wound and abandons himself to a perfect orgy of painful experience and self pity. When at last a tiny scratch is uncovered, gravely examined and gingerly touched with carbolated

vaseline, the cure is complete and the man goes back to work wholly satisfied.

If, however, the employer refuses to consider and treat the scratch and brusquely sends the man away, he is likely to spoil an otherwise competent laborer. The man will depart grumbling, his sense of injury will grow and he will continue troubled, half sick and wholly useless.

(To be continued.)

FREIGHTER LOADING COCONUT OIL AT OPOK.

WORKMEN'S COMPENSATION ACTS.

The National Industrial Conference Board, Boston, Massachusetts, composed of representatives of 16 national industrial associations, including The Rubber Association of America, has published an eight-page summary of the Board's report on the legal phase of Workmen's Compensation Acts in the United States. The history of such laws is outlined briefly, supplemented by tables showing when they were enacted by the different

states, territories, foreign countries and provinces. The compensation principle and constitutional questions involved are reviewed, and special emphasis is laid upon the lack of uniformity in state laws and the inconsistencies growing out of their interpretation. An exclusively compulsory compen-

sation system is advocated throughout the country to be substitutional for and not supplemental to employer's liability, claims to be settled directly between employer and employee conditioned by adequate safeguards for the protection of the latter. The compilation, under expert guidance, of a permanent, scientific, uniform system of accident data, compensation statistics and judicial decisions, it is stated, would go a long way toward establishing definite insurable standards of liability and of equitable premium rates. The full report is obtainable at \$1 per copy postpaid.

THE "MINDANAO" ON THE BEACH.

Automobile Tire Fabrics.

By Alvin Kingsbacher.

THE bigness of this subject lies not only in its possibilities, but in its very realities. The present-day application of tire fabric to industry and to society is enormous and one may naturally but wrongly infer that a greater development is likely to result from the present unprecedented demand for it.

I am prepared to contradict the belief—widely current, generally accepted and apparently supported by fact—that tire fabric is in its experimental stage. There have been so many innovations attempted, such as the substitution of ramie for cotton, the twisting of a wire with the component cotton threads of the yarn and the experimentation with other than plain weaves, such as leno and similar ones, that the failure of all these has not only removed the possibility of further development in tire fabric but has reflected greater merit on its present qualities and construction. In mentioning these various experiments it may be well to make evident in a brief manner the cause of their failures.

The substitution of a stronger material for cotton has necessitated the introduction of a fiber which has not the necessary properties of elasticity and flexibility. Any increase in strength without these qualities would not be considered an improvement, but rather a detriment. In twisting wire with cotton threads the difficulty encountered is to secure a wire of such a material as will possess the same elasticity as the cotton. Another feature of this construction is that the wire will tend to cut the cotton or other fibrous material.

In using leno or other weaves which, by crossing the threads, yield a stronger fabric, the objection arises from the cutting action of the threads. The effect of tire service on a fabric is so peculiar that it would not be long before the threads would cut each other in the places where they cross. From these observations of what has already been tried, it is natural to suppose that tire fabric has long since ceased to be an experiment. It stands to-day as a scientific certainty and is as much a standard commodity as army duck or any such similar fabric.

It is not my intention, nor have I the ability, to expound the theories of tire manufacture. My experience has been gleaned, firstly, in a cotton mill running exclusively on tire fabric, and secondly, in a tire factory as fabric analyst. It is my desire to combine these experiences in such a way as to give not only a fair idea of how fabric is made, but also what is expected

of it by the manufacturer who endeavors to make a reliable tire.

The pneumatic automobile tire is a complex combination of fabric and rubber. It has been created like most other inventions to meet existing demands, and having arrived at its present efficient stage, has succeeded in establishing for itself a monopoly, opposed to which countless devices designed to supplant it have not even made an impression.

The name "automobile tire fabric" is generic. It includes many kinds of fabric which are used in the construction of a tire, but the most important of these and the one that is used in greatest quantity is the "building fabric." It is estimated that of this style alone about sixty million square yards are used annually. In addition to this building fabric there are various other fabrics that go into the making of a tire. These sundry fabrics include special construction, known as "chafing fabric," "breaker fabric" and others, such as "Osnaburgs," "sheetings" and "tapes." The last two are used more especially in the process of tire manufacture and are not an inherent part of the tire itself. Then there is another fabric called "thread" fabric that is frequently used in making certain types of beads.

Before approaching the subject of fabric construction, I wish to outline in a crude and desultory manner the various processes through which the fabric must go before it becomes part of a tire. When the fabric is received at the tire factory it is inspected by the proper officials, and of this I shall deal at greater length later, but in this connection it is well to state that not all tire factories maintain a de-

A MODERN TIRE FABRIC LOOM.

partment of this kind. It is to the credit of a few that they do maintain this department. It bespeaks a high standard of quality, and the rigidness and thoroughness of inspection in regard to fabrics betokens a similar care and exactness in the selection of other materials and in the various processes of the manufacture.

After the inspection comes the drying process. The fabric is run over hot rolls and all the moisture extracted, as it is essential that the fabric be dry before it is coated with rubber. The "calendering" or "frictioning" process is the means of forcing the rubber compound into and onto the fabric. The spaces or "pores" in the fabric are filled with rubber and then the fabric is "skimmed" or coated with a layer of rubber. The fabric is then ready to be cut into strips, the cutting being on a 45-degree

angle in order to secure a greater strength and to prevent the unraveling of the threads in the strips. These strips, in various plies, depending on the size of the tire, are finally built up on a mold or iron core to form the fabric for the tire.

BUILDING FABRIC

The "building fabric," as previously mentioned, is the body of the tire. It is the most important fabric and as such must possess above all, strength, flexibility and elasticity. The fabric is a plain weave, and weighs approximately 17.25 ounces to the square yard. The yarns from which this building fabric is made are 11/22.5 or 11/23. The twist in the single yarn

BUILDING FABRIC.

is from 14 to 16 and the ply yarn is 4 to 5 turns per inch. The texture is 23 ends and 23 picks per inch. The gage of thickness of the fabric is .040 inch. The water content should not be over 5 per cent. The take-up is found to be about 14 per cent and the contraction of filling about 10 per cent, leaving normally a difference of 4 per cent in the amount of warp and filling yarn stretch. This is an important point in the construction of tire fabric. It is obvious that if the difference is too great, the filling, when the fabric is subjected to a strain, will arrive at its straight length before the warp and consequently will weaken or break before the straight length of the warp is reached. When the percentages of crimp or bend in the warp and filling are about equal, or within 5 per cent of each other, the warp and filling will tend to reinforce each other. In my capacity as fabric inspector I have analyzed so-called tire fabrics which had 32 per cent take-up in the warp and 7 per cent stretch in the filling. The difference of 25 per cent made them totally unfit for use in tires, although the fabrics were in every other respect perfect.

Building fabric is used in various grades, but the construction remains the same. Sakellaridis, or cotton grown in Egypt from Sea Island seeds, is a material that has become very prominent. The staple is longer and stronger than Sea Island, but is not quite so elastic. In color it is a yellowish white, a compromise between Sea Island and Egyptian. Long staple Sea Island, Combed Egyptian and Carded Egyptian are also used in great quantity, chief and most important of which is Sea Island.

CHAFING FABRIC.

Strength obviously is the paramount feature in a tire fabric and upon this factor there cannot be put too much emphasis. Every tire manufacturer, even though he has no fabric inspection department, has at least a tensile strength testing machine. There are various ways of testing, and each method results in a different standard of strength. For example, breaking a 3-inch strip in a 2-inch jaw is virtually

testing two inches of fabric, but will yield a higher strength test than if just two inches are tested. This is because the two inches in the former case are reinforced by the threads adjacent, although not held in the jaws of the machine. The standard of strengths, as stated below, is based on a different method of testing and yields a lower but truer breaking strength. A piece of fabric is unraveled down to one inch, representing in number of threads the exact texture of that inch. This strip of fabric is placed in the jaws and tested for strength, and can indicate no greater strength than the exact number of threads that inch actually possesses. According to this method of testing the following standard for strength in building fabric is obtained:

	Warp	Filling
Sakellaridispounds	340	360
Sea Island	319	320
Combed Egyptian	275	285
Carded Egyptian	260	270

A question may arise as to the cause of the difference in warp and filling strength. When it is remembered that the warp is woven under considerable tension, this difference in strength is readily understood.

BREAKER FABRIC.

The breaker fabric is applied on the tire just beneath the tread and its purpose is to protect the building fabric and to distribute the shock that the tire necessarily receives on the road over as

great a surface as possible. There are many and varied constructions of breaker fabric, each manufacturer having his own particular weave and construction. The average breaker fabric, if such there be, is somewhat similar in construction to the building fabric in respect to the yarns. The

BREAKER FABRIC, SQUARE WEAVE.

texture is very much lower in order to permit large openings in the fabric to accommodate more rubber than the other fabrics. The weight varies, of course, with the construction, but usually is somewhere around 10 ounces to the square yard. Twelve ends and thirteen picks per inch give the necessary openness to the fabric. The weave will vary anywhere from a plain weave to a mock leno. It is made of Sea Island, Combed Egyptian or Carded Egyptian. It is difficult to set a strength standard for this fabric, as any change in texture, weave or yarns will greatly modify any standard which may be placed upon it. However, with a construction such as is outlined above the breaking strength would be as follows:

	Warp	Filling
Sea Islandpounds	160	180
Combed Egyptian	140	155
Carded Egyptian	115	130

CHAFING FABRIC

The chafing fabric is used on the side walls of the tire where more flexibility is required, and is of necessity a lighter fabric. It is a plain weave weighing 9 ounces to the square yard. The yarns are 4/22.5 or 4/23. The gage or thickness is .022. There are 34 ends and 34 picks to the inch. It is made of Sea Island or Combed Egyptian and the breaking strengths are as follows:

	Warp	Filling
Sea Islandpounds	155	170
Combed Egyptian	125	140

The other fabrics, Osnaburgs, sheetings and tapes, need no particular mention, as they are standardized fabrics and differ in no respect from the fabrics that are on the market today.

Before discussing the inspection of the tire fabric, I want to touch upon some of the precautions that are taken in the mill in order to turn out a perfect fabric.

SPINNING, WEAVING AND FINISHING.

The spinning of the yarns is, of course, an important step in the work, and it follows that unless the maximum strength of the cotton is secured here the succeeding process of manufacture cannot yield a suitable tire fabric. The twisting of the single yarn into ply yarn is not such a simple problem as it appears. When 11 single threads are twisted into one there is always a possibility of one or more threads breaking and the twisted yarn continuing in its whirly course with a fewer number of component threads than the requirements demand. This feature is known as "dropped ends" and is a serious weakness when found in the fabric. It is absolutely essential that every piece of yarn should have its required number of component threads through its entire length; and to twist it with this un-failing accuracy involves the human element more than the mechanical, as the result depends largely upon the skill and alertness of the operatives. Throughout the entire handling of the yarns, warp and fabric, there must be avoided any contact with oil, dirt or grease. Rubber will not adhere to an oily or greasy fabric and the tire manufacturer is very particular in re-

gard to the cleanliness of the fabric which he buys. The mill runs its looms on all grades of yarn separately. A weaver may be running one loom on Sea Island and another on Egyptian and may inadvertently mix the bobbins, weaving into a Sea Island fabric one or more bobbins of Egyptian yarn.

BREAKER FABRIC, LENO WEAVE.

Such a fabric is said to have "mixed filling" and is generally rejected by the fastidious fabric buyer. It is important that there be no broken or knotted threads. When a filling thread breaks, the pick is pulled out entirely and the loom started with a new pick in its proper shed. In the case of a warp thread the yarn is spliced; that is, two or three component threads are knotted at a time in different places so that the binding of the broken yarn does not make a bulky knot. There must be no holes in the fabric and everything about it must be even and uniform. After the weaving comes the mending, burling, mill inspection, finishing and packing. The fabric is rolled and wrapped with paper and burlap for shipping.

TESTING.

The fabric, being a plain weave and of heavy construction, appears to most persons as a very simple one, but this idea is abandoned when the number and diversity of tests which the fabric must undergo at the tire factory, is known. These tests may be divided into two classes; the physical and the visual inspections.

The physical tests include tests for strength, weight, thickness, or gage, texture, take-up, contraction of filling, and water content. When these physical tests are made and found satisfactory the fabric is run over an electrically lighted inspection perch. This is the visual inspection and by its means every defect or irregularity in the construction of the fabric becomes apparent. The irregularities that are looked for are as follows:

Loop Knots
Warp Knots
Beat Ups
Bad Start Ups
Uneven Fabric
Slack Filling

Slack Warp Ends
Pulled-in Sides
Reed Marks
Drop End Yarn
Split End Yarn
Oil Stains

Hard Twist Yarn
Soft Twist Yarn
Mixed Warp or Filling
Mispicks or Double Picks
Smashes
Holes

BEAD FABRIC.

While the presence of any one of these may not of itself constitute sufficient grounds for rejection, a combination of several of them or the frequent recurrence of one of them, would place the fabric in the imperfect class and render it unfit for use in tires.

These strict specifications and

requirements for tire fabric give an idea of its importance in the building of tires. However, with increased knowledge of rubber compounds and tire construction, the importance of tire fabric may be in a measure reduced. These two need not necessarily conflict, as in its present form the pneumatic tire of to-day requires all the strength, flexibility and elasticity that can possibly be brought forth in a fabric.

COTTON TRADE NOTES.

THE Cookson Tire Fabric Co., Mansfield, Massachusetts, is being organized by Jos. H. Cookson, formerly superintendent of the Jenckes Spinning Co., Pawtucket, Rhode Island, who will have associated with him a group of local capitalists. A site has been secured, and contracts for machinery and equipment have been placed. The initial equipment is to consist of 40 cards, 7,000 spindles and 20 looms, with complementary machinery.

W. Irwin Bullard, treasurer of the Goodyear Cotton Mills, of Goodyear, Connecticut, and vice-president and general manager of E. H. Jacobs Manufacturing Co., is to be in charge of the textile department established by the Merchants National Bank, of Boston, Massachusetts.

BEAD THREAD FABRIC.

In many ways Goodyear, Connecticut, is developing rapidly as a result of its tire fabric mills. New machinery is being

installed which will increase the present weekly capacity of 100,000 pounds to 130,000 pounds. A new cotton storehouse with a capacity of 10,000 bales has been erected, and attractive modern cottages are being built along the lines of those at Goodyear Heights, Akron, Ohio. A total of 88 has already been put up. Social as well as industrial progress is being manifested through the Goodyear Band, singing orchestra, motion picture theater and weekly community dances during the winter months.

War News of the Rubber Industry.

THE DRAFT IN RUBBER MILLS

PROBABLY few industries have as large a percentage of young men of conscription age as are to be found in rubber mills. The prevalence of piece work is doubtless responsible for it. In Akron, "the rubber city," the majority of employees in the leading factories are between the ages of 21 and 31. From 10,000 to 12,000 Goodrich men are subject to call; 7,000 to 8,000 Goodyear men are similarly affected, likewise 4,000 to 6,000 Firestone men. While tire concerns such as these are particularly hard hit, they have taken a patriotic stand in claiming exemption for only a relatively few men who are extremely valuable to them, believing that in throwing their strength behind the present draft fewer men will be needed later.

The War Department startled rubber men by estimating Akron's population at 330,000, as against the 150,000 claimed by local authorities. A first draft of 2,200 men, based on that figure, will seriously hamper rubber mills, as even now it is difficult to obtain sufficient help to operate at full capacity.

At the outset it was believed that only a few hundred men in each factory would be affected by the first call and that many of them with wives and families would be exempted, but the high percentage of exemption claims throughout the country has resulted in a general relaxation of physical qualifications and the refusal of many local boards to exempt men with wives and children unless proof could be shown that they would suffer or become public charges. Rubber companies are, therefore, confronted with the immediate problem of filling many vacancies for the duration of the war. Girls and older men must be depended upon in most instances, especially the former, as a shortage of male labor exists in almost every industry. In Canada, England, France, Italy and Russia young women have bravely undertaken the work of men, and with the utmost success. In rubber manufacture they are to be found in every department except the milling room, and time may get the stronger women there too.

Although American women are no less willing or courageous, it is to be hoped that no dependents, perhaps physically unfit to withstand its rigors, will be forced into this work while thousands of unmarried alien men of military age and allied nationality escape service under any flag. While doing their best in men and industrial production for Uncle Sam, American rubber companies should stand firmly behind the principles of alien conscription and soldiers' insurance, that as few as need be of our wives, mothers and sisters be forced into factories, and that those who must make this or other sacrifices be assured a just reward should their loved ones be incapacitated or fail to return.

THE FAVORABLE SHIPPING OUTLOOK.

Importers of crude rubber and exporters of manufactured rubber goods find the present shipping outlook very heartening. Despite German submarine activities, statistics of the Department of Commerce show that our imports for the month of June broke all records by a large margin, and our exports exceeded those of any month except last January, while our total ocean-borne trade for the fiscal year ended June 30, was carried to a high level never dreamed of before the war, an increase of nearly 50 per cent over 1915.

During the past six months U-boats have sunk only a fraction of the tonnage predicted by German experts, and the under-sea fleet itself has suffered such losses that probably less than 200 submarines are now available for service. Arrivals and sailings at British, French and Italian ports are on the increase and neutral shipping is suffering less than formerly. On July 1

the British merchant marine comprised 18,000,000 tons of seaworthy ships of all kinds, and according to carefully compiled figures in the "London Times" Great Britain and the United States will in 1917 turn out a new ship tonnage in excess of that destroyed during the year, while in 1918 British and American shipyards will probably build no less than 8,000,000 tons of standardized cargo vessels.

Meanwhile, conditions will be improved by an arrangement nearing completion between Great Britain and the United States for joint control of the world's shipping. The Shipping Board is about to commandeer the entire American seagoing tonnage, not for government operation but for control of charters, direction of trade routes, priority of shipments and to lower freight rates so as to insure fair, rather than extortionate profits harmful to the allied cause. Our export embargo is bringing neutral shipping under United States control, both Norway and Holland having already offered to release virtually half their tonnage in return for food shipments, and the more recent embargo on iron and steel required for ship construction will bring the growing Japanese Pacific merchant fleet into Atlantic service. Apparently the complacency of rubber companies regarding their incoming and outgoing shipments is justified, and the complete elimination of the Goethals-Denman controversy lends a sense of added security.

THE AMERICAN AERIAL FLEET.

Absolute air supremacy is primarily responsible for recent allied gains on the western front. This supremacy must be maintained and increased despite Germany's feverishly hasty building program. That the United States will do its part and more in air service was assured when, late in July, the \$640,000,000 aviation bill became law, the largest single appropriation ever passed by Congress for one project.

Less than half this amount is to be expended in the purchase of airplanes alone. Personnel, training equipment, overseas maintenance, spare parts, flying stations, armament and scientific apparatus, all are to be provided for and are equally as important as the manufacture of the machines. One hundred and ten thousand officers and enlisted men—an army of the air greater than our standing army of a few months ago—will be needed. The whole project is one which appeals to the imagination of our people and to the genius of our American engineers, who, with the cooperation of the Society of Automotive Engineers, have worked out standardized types of fighting, reconnaissance and bombing airplanes for quantity production under the direction of Howard E. Coffin, chairman of the Aircraft Production Board of the Council of National Defense. More than 20,000 planes are to be built as a first increment and more will follow as needed.

THE WAR INDUSTRIES BOARD AND PRIORITY.

While the newly appointed War Industries Board represents a notable step forward and will doubtless accomplish much toward concerted action in production and distribution, it must necessarily labor under great difficulties in having no direct vested powers. Its functions, like those of the Council of National Defense, are merely to investigate and recommend, yet the executive and administrative departments of the government are lending it hearty support. Such matters as a general basis of prices on war materials for the government and the Allies, and priorities on government and allied contracts are already under consideration and a satisfactory conclusion may be anticipated.

It is expected that this board will eventually develop the need of an organization with all the powers of the British Ministry

of Munitions to minimize the disruption of normal business life by the war; to eliminate the harmful results of uncontrolled prices, and to prevent a breakdown in the distribution of the nation's output.

As a forecast of what may eventually develop in America, the workings of the Priority Branch under the British Ministry of Munitions are of interest to the rubber industry, because among the many industries affected are rubber trades and manufacture, including footwear; waterproofing of fabrics; manufacture of coal-tar and other chemical products; textile trades and manufacture and machinery.

The Priority Branch in England has for its function the bringing about of harmonious actions between the conflicting demands of the different departments of the Ministry of Munitions, of the Admiralty, the war and other government offices, the railroads, the mines and other quasi-public services and approved private industries, which are in more or less active competition for their share of raw materials, manufacturing capacity and labor.

The committee meets every day and no priority can be granted unless all present agree. One objection rejects an application—but this decision is not final. The representative of the interested department may withdraw the application and refer the matter through the chief of his department to some one representing the Minister of Munitions, who is the final authority.

A manufacturer instructed as to priority by the committee can himself issue certificates to bring about similar priority on materials of sub-contracts for his contract.

All persons engaged in certain industries have their work divided into three classes—*A*, *B* and *C*. *A* is war work, *B* other work of national importance, and *C* is all work not comprised in the other two.

Class *A* comprises work or material wholly required as a component part of any work or goods to be carried out or supplied under

(a) A government war contract which signifies: 1—Any contract placed by the Admiralty, the War Office or the Minister of Munitions; 2—Any contract for naval or military equipment placed by an allied government by or with the consent in writing of the Admiralty, the War Office, or the Minister of Munitions.

(b) Certified war work which signifies: 1—Work on a contract or order which the Admiralty, the War Office, or the Minister of Munitions has certified in writing to be war or munition work; 2—Work which the Minister of Munitions has directed to be treated on an equality with war work.

(c) Merchant shipping work certified in writing by the Board of Trade to be munitions work.

The priority branch grants priority in class as follows:

- 1—Most urgent war work.
- 2—Very urgent war work.
- 3—Urgent war work and
- 4—War work.

In addition there is an emergency classification which takes precedence over all.

The manufacturer is not compelled to accept work from the government and when a manufacturer accompanies an order to another manufacturer with a certificate which would entitle this order if accepted, to priority, the manufacturer to whom the order is tendered need not accept the order unless he desires to sell. There is, however, strong indirect pressure to accept priority orders because a priority order gives assurance that steel and other scarce raw materials may be secured, that transportation will be afforded, and also that a plant engaged upon priority work will have an adequate supply of labor.

The priority committee issues orders from time to time that no scarce material shall be used except on Class *A* work or Class *A* and *B* work.

Reports are required of all stocks in Great Britain of certain listed scarce material, and from time to time the Minister of Munitions takes possession of all stocks of certain character.

From time to time the priority branch requests of the manufacturer, a list of all of his orders, giving customer's name, and full particulars including what proportion of the work remains to be done.

WATERPROOF FABRICS FOR BALING ARMY STORES.

A new use has been found for waterproof fabrics. The Storage Committee of the Council of National Defense is urging all shippers to adopt every measure possible to minimize the need for railroad cars, and their use for storage purposes. The advantages of motor trucks for short hauls are being emphasized; likewise the importance of creating additional storage facilities at points of production to avoid congestion in manufacture, and at points of consumption that railroad cars may be unloaded promptly.

That every car may be loaded to its maximum capacity with the minimum of packing material, baling or compressed bulk packing is developing great possibilities for saving transportation space. The Quartermaster's Department of the army is already baling socks and blankets and satisfactory progress is being made toward baling uniforms, shoes and even prunes. The bales are covered with waterproof material which will later be used for sand bags at the front. Its use makes possible the employment of flat cars when box cars are not available.

It would seem that several articles of rubber manufacture would lend themselves to bulk packing, such as hospital and camp sheetings and blankets, waterproof fabrics for all purposes, leggings, ponchos and rubberized clothing of every sort, gas masks, rubber springs, gaskets, washers and valves, sponges, hot water bottles, ice bags and caps.

STYLE CONSERVATION.

The Commercial Economy Board of the Council of National Defense has recently recommended that manufacturers reduce the number of styles of their goods and that in place of elaborate, fancy styles the output should be confined as closely as possible to standards. The board has stated that in some lines this reduction could be as high as 25 to 50 per cent without inconvenience to customers.

As regards the rubber business, interviews with leading manufacturers show that, as a rule, they do not consider any great reduction of styles possible except with a resulting diminution of business. Take, for instance, tennis shoes: While the leading manufacturers do most of their business on three or four standard lines, there is a demand for finer goods on which the sales, in comparison, are few but, in the aggregate, many. With the leather shoe manufacturers putting a lot of style in their product the rubber shoe producers find there is a demand for similar "classy" shapes, with high heels and canvas tops, in rubber-soled footwear. The United States Rubber Co. endeavors to get out as few styles as possible with which to satisfy the demands of its customers and the public. It is the opinion of the sales manager that the proposition of the Economy Board is impracticable, as far as tennis goods are concerned.

Regarding rubber footwear, that is, overshoes of all kinds, the same conclusion holds. Rubber shoes must fit reasonably well the prevailing styles of leather footwear, and therefore the makers of overshoes must make a larger variety than if leather shoes were standardized.

In rubber and other waterproof clothing the action of the branch store managers at a meeting in Chicago early last month indicates the situation. These managers advocated a material reduction of models and styles to be introduced this season, and in consequence of this recommendation the company will feature standard models, patterns and styles, which make for economy and the best value for merchants and consumers, which decision is in accord with the company's policy of standardizing the raincoat business.

Among tire manufacturers the opinion is that something could be done, although this field for the practice of economy in styles, sizes, etc., is not so rich in opportunity as many others. The expensive equipment of cores, molds and machinery for tire making represents an outlay that could not be charged off in part without serious effect on the balance sheet. The tread types appear to be jealously guarded as part of the selling assets and the result of advertising expense that could hardly be dispensed with and meet competition. The tires are really known by their treads.

GOVERNMENT USE OF LEATHER SUBSTITUTES

When a peaceful nation like the United States goes to war the drain upon leather stocks is tremendous. For instance, in July the Quartermaster-General's Department awarded contracts for 2,175,000 pairs of marching and field shoes. Large quantities of saddles, harnesses, puttees and other articles, in whose manufacture leather is absolutely indispensable, are also being purchased. This sudden demand, in addition to the normal needs of the country, makes it necessary to conserve leather by employing other materials wherever possible. For several years American manufacturers have been turning out leather substitutes of the celluloid type, that have proved highly satisfactory for upholstery purposes, seat cushions, book binding and the like.

After exhaustive tests government officials have adopted certain grades for different purposes. The most important immediate use will be in ship upholstery, for which purpose its waterproof quality, freedom from mildew and mold are particularly important. It is uniform in thickness, strength and quality. It also saves the waste usually lost in cutting out imperfections and irregular edges of leather, as well as the expert labor necessary to do such cutting. Du Pont Fabrikoid is being manufactured in large quantities for the purpose.

MEDICAL RUBBER GOODS MANUFACTURERS.

The government will require enormous amounts of surgical rubber goods, and to facilitate the placing and filling of orders the Medical Rubber Manufacturers' War Emergency Association has been formed. A. W. Warren, of the Hodgman Rubber Co., Tuckahoe, New York, is president; W. S. Davison, of The Miller Rubber Co., Akron, Ohio, is vice-president, and J. Russell Parker, of Parker-Stearns & Co., Brooklyn, New York, is secretary and treasurer. These gentlemen form the committee having for its object the purpose of mobilizing the manufactures of any or all lines of surgical rubber goods with the idea of taking care of the requirements of the Army, Navy, Red Cross, and possibly the Allies, during the continuance of the war. This committee is to obtain from each manufacturer data as to his capacity for producing any of the lines of merchandise required, samples of the merchandise itself, and the price at which they are prepared to supply it. All prices are presumed to be based on costs plus 10 per cent. This committee is acting as a sub-committee of the Committee of National Defense, and is supposed to transmit to headquarters its recommendations as to the quantity of goods to be allotted to each manufacturer and the price.

There are three sub-committees working in connection with this executive committee: one of which, with W. S. Davison as chairman, has charge of the orders of surgeons' gloves, catheters, colon and rectal tubes; the second, under chairmanship of A. W. Warren, will handle the requirements for rubber sheeting and rubber coated goods of all kinds; the third, under the chairmanship of J. Russell Parker, is devoted to hot water bottles, fountain syringes and goods of that character.

It is estimated that the manufacturers of these various lines who will cooperate in this movement have a combined capital of over \$100,000,000 and facilities for turning out these classes of goods in any desired quantity in a minimum time after receiving orders. Druggist's sundries of American manufacture have already established a reputation for reliability in Europe.

EMBARGO LIST EXTENDED.

Supplementing the embargo proclamation of July 15, an account of which was published in the INDIA RUBBER WORLD, August 1, 1917, President Wilson has announced two lists of commodities which cannot be exported, except under special license, after August 30. One list prohibits practically every article of commerce being shipped from this country to enemy nations or to neutral countries of Europe. The second list, for which license is required for shipment to the Allies, their dependencies and the neutral countries of both continents, includes several additional chemicals, ingredients and materials not mentioned in the previous proclamation. As forecast in our previous account, cotton and cotton linters are now on the prohibitive list. Other commodities more or less important in the rubber industry are benzol and its derivatives, benzine, gasoline, ether, cottonseed oil, linseed oil, rapeseed oil, corn oil, glycerin, toluol, resin, turpentine, sulphur, acetone, ammonia and ammonia salts, sulphuric acid, nitric acid, white lead, lead, zinc, copper, plumbago. Copper wire and electrical equipment, electrical motor accessories, aeronautical machine parts and accessories are also included in this second prescribed list.

The regulations, orders, limitations and exceptions prescribed will be administered by and under the authority of the Exports Administrative Board from whom licenses in conformity with said regulations, orders, limitations and exceptions will issue.

CAPTAIN BUCKLETON AIDS RED CROSS.

Captain Ernest E. Buckleton, whose services as a soldier and as one of the first who hastened to the help of the suffering Belgians are well known, although unable to continue in active service at the front because of injuries sustained at the battle of Loos, is still at work for the Allies. In gaining money for the Red Cross and in talks to recruits at various American camps, he has done much. As we go to press word comes that, during a week-end at Orleans, Massachusetts, he reviewed and addressed the newly formed Home Guard. He also spoke for the Red Cross in the local theater, on Trench Warfare and the historic retreat from Mons to the Marne. Not only was the building filled, but hundreds were turned away. The collection for the Red Cross taken at that time amounted to \$125.

SERVICE PERSONALS.

Francis E. Drake, general European agent of the United States Rubber Co., has resigned that position to serve on the staff of General Pershing at the front in France.

Thomas F. O'Neil, advertising manager of the General Tire & Rubber Co., Akron, Ohio, has enlisted in the naval militia and is in training at Tarrytown, New York.

Frank R. Bacon, president of the Cutler-Hammer Manufacturing Co., Milwaukee, Wisconsin, has been called into service as a captain in the Federal commissary department.

C. V. McMillan, manager of the Wichita, Kansas, branch of The B. F. Goodrich Co., Akron, Ohio, has enlisted in the Kansas Field Artillery. N. A. Nelson succeeds him as local manager.

Sergeant P. F. Talley, a veteran of the Philippine and Boxer campaigns, has succeeded Lieutenant Walker in charge of the drill classes of The Goodyear Tire & Rubber Co., Akron, Ohio. Lieutenant Walker having been called to active service with the Ohio National Guard.

Frank Waldo, of the firm of E. M. & F. Waldo, 11 Broadway, New York city, has been selected as a candidate for appointment as an officer in the United States Army and has been directed to report at Plattsburg, New York, on August 25, where he will enlist for a period of three months for training purposes.

Second Lieutenant M. DeMott Letherman, of the United States Rubber Co., New York office, has sailed for France, with a party of American officers, to observe French trench tactics.

Walter H. Nolan, assistant manager, Springfield, Massachusetts, branch, The B. F. Goodrich Co., is at Plattsburg, New York.

COMPANY NOTES.

The United States Tire Co., New York City, has made extensive alterations in factory equipment for the manufacture of solid tires for Class A and B military trucks, according to the standard design worked out by the Motor Transport Board of the War Department with the cooperation of the Society of Automotive Engineers.

H. F. Davenport, secretary of the Brunswick-Balke-Collender Co., Chicago, Illinois, is prepared to demonstrate very graphically, in the form of an open letter to the trade, just what \$9,000,000,000 signifies, this being the amount the Secretary of the Treasury McAdoo states will be spent by the government and our allies within the United States during the next year.

Girls employed by The Fisk Rubber Co., Chicopee Falls, Massachusetts, are taking an active part in war activities. The Fisk Unit of the Volunteer Clerical Corps, which is helping the government with the vast amount of detail work incident to registration and other new enterprises of the war, has alphabetized and classified over 15,000 registration cards in western Massachusetts. Delegates have also been sent every evening to the Springfield Armory, an army service rifle manufacturing establishment, where greatly increased production requires much additional clerical work.

The Fisk girls are also active in Red Cross work, and as several Fisk men are in the Second Regiment, Massachusetts National Guard, an ambulance was presented to that regiment by the Fisk company.

The first woman motor truck driver in western, perhaps in all, Canada is Mrs. Eva Crane, who drives one of the delivery cars for the Winnipeg branch of the Dominion Rubber Sytsem. In her appropriate khaki suit Mrs. Crane loads and unloads her own car; gets her orders from the office; delivers goods to cus-

tomers and railways, and works beside the warehouse men in the shipping department. She asks and accepts no assistance other than is ordinarily accorded to a man on the job. Her work is entirely satisfactory and she is satisfied with her position. "I took the job," she said, "so that some healthy, physically fit man could go overseas and fight alongside my husband and brothers in the trenches."

The Rubber Trade Roll of Honor.

Reported by The Rubber Association of America.

Numbers in parenthesis following individual names indicate branches of service as shown by the key list on page 708.

Rene L. Robiquet, for some years with the London and Manos houses of Alden's Successors, Limited, who is fighting for his native land as a private in the 24th Regiment of Infantry of France, has won the *Croix de Guerre* "for great bravery in the field and devotion to duty." M. Robiquet married an Englishwoman, who, with their daughter, is living in England.

Bowers' Specific Gravity Tables.

IN the August issue of THE INDIA RUBBER WORLD the Bowers' table for computing the approximate weights of disks was published in full and also several samples were given to illustrate the method to be followed in making computations. The table for cylinders that follows is used in determining the weight of cylinders such as typewriter platens, tubes, bands, springs, tubing, made on a tubing machine or by hand, cylindrical coverings for shafts and paper mill rolls. The range of the table is from 1/64 inch to 3 inches for cylinders of customary measurements.

CYLINDER TABLE.

The stated base of the cylinder table is 62.4256 + pounds per cubic foot.

The unit used is .00133 ounce equals a cylinder 1/64 inch diameter, one foot long. Specific gravity 1.00.

$$.00132996 \text{ ounce} \times (12 \times 64)^2$$

$$= 62.4256 + \text{pounds.}$$

$$.7853982 \times 16$$

Weight of one cubic foot of water 39.1 degrees F. (maximum density) = 62.425 pounds. (Kent, 1916 edition, page 27.)

To convert the cylinder table into weights according to above standard, multiply by 0.9999 + or divide by 1.00001 ±.

The cylinder table is constructed to read from 1/64 inch diameter up, in the same manner as the disk table:

1/64 inch to 3 inches by 64ths in ounces	
1/32 inch to 6 inches by 32nds in ounces	
1/16 inch to 12 inches by 16ths in pounds	
1/8 inch to 24 inches by 8ths in pounds	
et cetera	
1 1/64 inch = 5.61925 ounces	
2 1/32 inch = 22.47700 ounces	
4 1/16 inch = 89.90800 ounces = 5.61925 pounds	
8 1/8 inch = 22.47700 pounds	
et cetera	
16 1/4 inch = 89.90800 pounds	

The variation between the weights of a cylinder one foot diameter, one foot long, specific gravity 1.00 determined from the disk or cylinder table is as follows:

Cylinder table	49.029120000 pounds
Disk table	49.007296512 pounds
Difference	0.021823488 pounds

The combined use of both the disk and cylinder tables in one calculation will be found convenient, practically accurate results will be obtained.

The volumes of two similar solids are to each other as the cubes of their linear dimensions. (Kent, 1916 edition, page 62.)

To determine the weights per gross of washers and kindred articles, the combined use of the following factors and the cylinder table will simplify the calculations:

144 disks one inch diameter	=	1 cylinder one inch diameter
1/64 inch thick	=	3 1/16 foot long
1/32 inch thick	=	1 1/8 foot long
1/16 inch thick	=	3/4 foot long
1/8 inch thick	=	1 1/2 feet long
1/4 inch thick	=	3 feet long
et cetera		

SAMPLE.

Washers—1 1/2 inch diameter, 1 inch hole, 1/4 inch thick, Specific Gravity, 1.50.

When extreme accuracy is not required the cylinder table may be used to determine weights of round flange rings using average of circumferences for length of cord.

SAMPLE.

Round Flange Ring - $7\frac{7}{8}$ inch diameter, $7\frac{1}{8}$ inch hole, $\frac{1}{4}$ inch round flange.
COMPUTATION.

$$\begin{array}{rcl} \frac{1}{4} \text{ inch diameter} & = & .34048 \text{ ounces} \\ 7\frac{7}{8} \text{ inches average circumference} = 23.955 \text{ inches} & = & 2 \text{ feet} \\ & & .68096 \text{ ounces} \end{array}$$

AMERICANIZATION ACTIVITIES IN RUBBER MILLS.

IN response to the questionnaire issued to firm members by The Rubber Association of America at the request of the Immigration Committee of the Chamber of Commerce of the United States of America, the following interesting data have been compiled from the replies from 78 establishments, 52 of which reported a total of 26,003 foreign-born workmen, or 29 per cent of the total number employed.

Averages show that at least 15 per cent of these foreign-born workmen cannot speak English well enough to understand even the simplest commands. This condition is most striking in the larger plants—two employing 7,500 and 3,000 foreign-born respectively, reporting 53 and 75 per cent. In 45 plants only 27.3 per cent of the foreign-born have been naturalized, while in seven plants the number is not known. In other words, 72.7 per cent of the foreign-born workmen, or 21.08 per cent of the total workmen are aliens. In 35 plants it is known that 71 per cent desire to become citizens, while in 17 of these the number reaches 100 per cent.

When asked whether a census covering these points would be of value, 12 answered affirmatively, six negatively and 34 did not reply. The replies showed that the number of foreign-born and their ability to speak English was quite generally known, but the naturalization status was but roughly estimated by 45 plants and only 35 had any idea whatsoever of the number desiring citizenship.

Seventeen plants help their employees to learn English, but only two conduct classes within the plant, the attendance being on company time in one and on the employees' time in the other. However, 27 cooperate with public night schools and 14 arrange adjustments between the class hours and plant shifts to make continued attendance possible. All endeavor to treat foreign and native-born alike and 39 discourage all epithets such as "dago," "hunkie," etc.

Central employment offices are maintained by 36 plants, to handle all matters pertaining to hiring, firing, promotions, transfers, voluntary lay-offs, and other matters relative to promoting fair treatment for foreign-born workmen. The incentives to create a contented and stable labor supply vary. Safety and first-aid work are maintained by 36, lunch rooms by 20, wash rooms by 29, while insurance benefits are given by 29, and bonuses by 18. Seven plants do specific work for the housing of their workmen. Welfare work of various kinds is carried on by 21 plants, while 26 keep in touch with social-betterment movements in the community, which affect their workmen.

It is interesting to note that in the six plants employing over 1,000 foreign-born, the 19,495 foreign-born employees constitute 47.5 per cent of the total employees, at least 35 per cent do not understand English and only 14.2 per cent have been naturalized. A chart which has been prepared in this connection, shows that as the average ability to speak English increases and approaches 100 per cent the percentage of employees naturalized also approaches the same maximum. The results also show that the alien's desire for citizenship increases in direct proportion to his ability to speak English, which is his medium for the absorption of American ideas and thus an index of his ability to appreciate the value and meaning of American citizenship.

At a time when business is lending all efforts toward maximum efficiency Americanization work takes on greater than normal importance and the further suggestions of the Immigration Committee, based on the conditions as reported, commend themselves to every manufacturer.

1. GENERAL. In practically all cases there is lurking a complete and coordinated plan of work for all the personnel activities of the plant under the supervision of a trained and tactful director.

2. CONFERENCES. Collective action is needed and frequent conferences with superintendents and foremen will help to create a clear understanding.

3. A CENTRAL EMPLOYMENT DEPARTMENT should be organized under the direction of a responsible executive, which shall have charge of all personnel work. All matters connected with employment, transfer, promotions, layoffs, dismissals, physical conditions, affecting the comfort and social needs of the men inside the plant and all community relationships affecting education, citizenship, housing and standards of living, should be cleared through this department, no matter what their source. It should be the clearing house for employees where grievances and complaints can be heard and adjusted and advice and information can be given.

4. REGISTRATION. All applicants for employment should be registered when they apply for work even though a vacancy does not exist, so that immediate contact can be made later.

5. THE APPLICATION BLANK for employment should contain definite questions relating to the applicant's residence in the United States, his literacy in the English and his native language and his citizenship status.

6. PROMOTIONS. The reverse side of the "Employee's Record" card should be used for recording efficiency and producing ratings, regularity, etc., which should serve as the basis of promotions. A policy of promotions from within the plant, properly announced, thoroughly understood and consistently adhered to will do much to increase efficiency.

7. DISMISSALS. Records should show number of men discharged and those who quit voluntarily and the reasons therefor. There should be a definite rule that all firing should be done through the employment department and all persons leaving the company's employ should be carefully interviewed. Causes of dissatisfaction can thus be determined and adjustments or transfers to other departments in the plant can be made.

8. A NURSE should be employed, speaking foreign languages, to follow up cases of absence, remove the causes and develop an American standard of living in the home.

9. SAFETY-FIRST WORK. Until all employees learn to read English some of the safety rules should be printed in the important foreign languages and posted.

10. INSURANCE. Special efforts should be made to gain the understanding and interest of the foreign-born employees in the plant association which will bring them into social contact with the American employees—a very strong factor in Americanization. Lunch, reading and rest rooms should be provided, which will further mix the workmen, and raise their working efficiency through relaxation.

11. SAVINGS. Greater thrift means higher standards of living, and a more efficient and stable labor supply. Local banks may be induced to send a teller to the plant every pay day and officially accept deposits there.

12. A COMMON LANGUAGE. If a definite cooperative arrangement cannot be made between the plant and the public schools to stimulate attendance—similar to the Detroit plan—another and perhaps better method is the establishment of classes in the plant before or after shifts, and before the men are scattered to their homes. (Standards and methods for this work can be secured from the Division of Immigrant Education of the United States Bureau of Education).

13. A UNITED CITIZENSHIP. All those desirous of becoming citizens should be enrolled in special classes and receive instruction in the principles of the American form of government.

14. HOUSING. It is well to keep careful records of employees' housing and living conditions. Bad home conditions tend to increase the labor turnover by stimulating search for work in other communities. The stability of the labor supply is largely dependent on the creation of a home-stake in the community.

15. COORDINATION OF PLANT ACTIVITIES WITH CITY-WIDE AMERICANIZATION WORK. A conference of the industrial leaders in each locality should be called at which the conditions, principles and methods of Americanization work for the community and the industrial plants can be outlined. One plant is so dependent on another, with respect to labor supply, that every effort should be made to coordinate city-wide work to promote the loyalty and stability of the alien workmen in the national crisis the country is facing.

ACCORDING TO "THE TIRE RATE BOOK" THERE ARE IN THE United States 40,912 firms of whom tires can be bought at retail. These are divided as follows: 25,924 dealers; 23,686 garages; 12,471 machine shops; 5,675 firms having auto-supply departments, and 2,503 supply stores. Many firms, of course, are listed in two of these classifications.

The Rubber Association of America.

MECHANICAL RUBBER GOODS MANUFACTURING DIVISION MEETING.

AN important meeting of the Mechanical Rubber Goods Manufacturing Division of the Rubber Association was held August 15 at 17 Battery place, New York City. There were present 25 members representing 22 manufacturers. The following communications from the Committee on Cotton Goods of the Council of National Defense were read:

The unusual requirements for tentage and other heavy duck has necessitated the utilization of looms not ordinarily employed on these fabrics to the extent that much of commercial business has of necessity been curtailed and many looms adapted to hose ducks have been put on numbered ducks and tent ducks. Knowing the vital necessity of railroad supplies, particularly of air brake hose, steam and signal hose, which is essential to the proper maintenance of the railroad equipment, it was realized that unless accurate figures were secured of the supplies now available of these several fabrics, and the quantity likely to be required during the next year, it might be possible that by employing machinery usually engaged on these fabrics on other work, it would not be available to supply the demand when needed.

We have, therefore, to request that you furnish us with as nearly accurate figures as is possible of the present visible supply of air brake, steam and signal hose ducks in the possession of the various rubber manufacturers as well as the stock of these made up articles in the possession of the various supply houses, that we may report to the Council of National Defense at Washington the available supply, as well as the probable requirements for the next year, in order that proper provision may be made with the cotton goods manufacturers for taking care of these requirements.

We acknowledge receipt of your favor of August 2 which was taken up and discussed at the Committee meeting of yesterday. The sense of the Committee was that it would be ill advised to send our inquiries direct to the trade in general. Have to advise that you secure by best means possible through your Committee the information desired on steam, air brake and signal hose ducks. We would also request that you ascertain as soon as possible the quantities of stocks of 30 and 32 ounce belting duck in 42 and 50-inch widths.

A general discussion of the duck situation followed, and every member present gave his views on the question. From the remarks it was evident that a number of firms represented had orders and contracts for manufactured goods running well into next year, and in some instances they had contracted for a supply of cotton duck, yarn, etc., to meet their requirements. There seemed to be a general feeling, however, that the requirements of the government would make it impossible for the cotton manufacturers to deliver to the rubber trade all the materials called for.

The question of preparing figures showing the amount of unfinished and finished stock on hand and an estimate of the amount of cotton goods necessary to meet the demands for the coming year was also thoroughly considered at the meeting and it seemed to be the general opinion of those present that before this was done the members of the Division should have a clearer understanding of the cotton fabric situation and more definite information as to the possible requirements of the government under the present unusual conditions. All expressed their perfect willingness, however, to give the Committee or representatives of the government any information they might desire including the amount of stock on hand, etc., if called upon to do so.

From the discussion it was evident that there was a general feeling that a Committee to represent the members of the Division should be named to investigate the present situation and secure all data possible, as to present and possible future conditions, for the information of the members of the Division so that intelligent action could be taken.

The Chairman suggested that the proposed committee be made a permanent committee to handle matters of this kind and stated that it was his opinion the cotton situation was at all times of sufficient importance to require a special committee to treat with any situation which might arise.

It was unanimously voted to appoint a committee of seven to confer with the cotton duck, yarn and other manufacturers of cotton fabrics and to investigate the entire situation, seeking any necessary information at Washington, and reporting its findings

to the members of the Division as promptly and fully as possible.

The Chairman appointed Messrs. Cobb and Bailey as a committee to submit a list of nominations for the proposed committee. The following firm members were nominated and unanimously elected, their representatives to be designated by the companies named: Rubber Goods Manufacturing Co., The Goodyear Tire & Rubber Co., The B. F. Goodrich Co., Fabric Fire Hose Co., Boston Woven Hose & Rubber Co., United & Globe Rubber Manufacturing Cos., Republic Rubber Co.

During the discussion, Mr. Beynon, of the Dunlop Tire & Rubber Goods Co., Limited, stated that he was particularly interested in whatever action was taken by the Division, and also what the attitude of the U. S. Government might be in the matter, as he thought it very likely that the Canadian Government would take action along the same lines.

Mr. Voorhees stated that at least 20 per cent of the available looms for cotton goods had been taken over for government work exclusively and that this percentage would undoubtedly be increased to fully 50 per cent within a year.

By special invitation, J. Spencer Turner, chairman, and C. S. Green, secretary, of the Committee on Cotton Goods of the Council of National Defense, were present to explain the difficulties encountered by the cotton goods people.

Mr. Turner stated that he thought if the manufacturers of rubber goods could obtain from the government some definite expression as to its requirements for the coming year, it would facilitate the solution of the present day problem. On the other hand, it should be brought to the attention of the government that there were certain lines of goods, such as air brake hose, steam hose, etc., which were being delivered to the railroads and were of such vital necessity as to be classed as war material.

Mr. Turner also referred to the fact that while the manufacturers throughout the country must make every effort to meet the government demands, at the same time their regular domestic trade should receive some consideration and it would seem that a thorough understanding of the interests of all parties concerned should be given just and fair consideration.

In response to a question Mr. Turner assured those present that a large percentage of the facilities of duck manufacturers throughout the country had of necessity been given up to government work and he seemed to think that cooperation on the part of the manufacturers of rubber goods with the duck manufacturers was the best solution of present difficulties. He stated he was sure the cotton duck people would be very willing to confer with representatives of the rubber goods trade at all times to adjust the distribution of cotton goods as much as possible.

A committee of three was appointed to suggest topics to be brought up and discussed at the monthly meetings. This committee consists of the following: A. Boyd Cornell (chairman), J. J. Voorhees, Sr., George A. Wies.

ANOTHER RUBBER SMUGGLING PLOT DISCOVERED.

Charged with smuggling rubber medical goods and platinum into Germany by way of Holland and Belgium, nine men, said to be citizens of Belgium, six of them reported to be firemen on a Belgian relief ship chartered to convey relief supplies from the United States to their destitute countrymen, were arrested in New York City August 10, culminating a long investigation of the methods by which Germany has been able to get much needed supplies from America.

Agents connected with the Department of Justice believe that merchandise valued in this country at from \$25,000 to \$30,000 has been smuggled weekly from Atlantic ports. The value of these articles is said to be fivefold in Germany.

According to the police, the six men were walking rubber shops. Under their clothing, the detectives assert, they found soft rubber medical articles, wrapped layer upon layer, about their bodies, giving them a puffed-up appearance. One man carried more than 100 bathing caps between his skin and underwear.

The six men gave the police much information regarding the underground smuggling system and several German agents from whom these men obtained goods are also under arrest.

Jelutong, or Pontianak, Is Crude Rubber and Duty Free.

A CASE of much importance to importers and users of Jelutong, or Pontianak, rubber was recently decided by the United States General Appraisers. This rubber had always been admitted free of duty until June, 1916, when the government suddenly assessed an import duty of 10 per cent on it as a non-enumerated, unmanufactured article under the provisions of paragraph 385 of the tariff act of 1913. L. Littlejohn & Co., Inc., New York City, importer and dealer in crude rubber, protested, claiming that Jelutong was a crude rubber, and as such entitled to free entry under paragraph 513. The decision recently handed down sustains this protest.

The case was tried on February 19, 20 and 21. The attorneys for the importers were Thaddeus S. and Edward P. Sharretts, the government being represented by Assistant U. S. Attorney-General Hanson, with Robert Hardison as special counsel. Frederick J. Maywald, the chemical expert, collaborated with the attorneys in preparing the case, and some of the government officials, as well as others interested in the case, declared that it was one of the best presented and most completely prepared cases which had ever been brought in the Customs Court. A large number of witnesses, technical experts and manufacturers, were called on the importers' side, and a great many exhibits were introduced in evidence.

The testimony on behalf of the importers covered three distinct lines, *viz.*, first, the trade meaning of the term "india rubber" as used in the Tariff Act; second, the trade classification of Jelutong, or Pontianak, by importers and rubber manufacturers; third, the chemical and botanical identity of Jelutong as a rubber.

John T. Callahan, president of the Archer Rubber Co., testified that there was no difference between rubber and india rubber, which refers to all the various types and grades of crude rubber among which is Jelutong. He stated that his company bought Pontianak, or Jelutong, as a crude rubber and used it as such; that Jelutong was one of the various rubbers used in its compounds, and that it was necessary to mix various rubbers in order to obtain certain desired results. He said further that his company never used Pontianak, or Jelutong, except as a crude rubber, and knew of no other use for it; that it was never used as a filler.

William E. Bruyn, treasurer of L. Littlejohn & Co., Inc., testified that his company bought and sold Jelutong purely as a crude rubber, and that throughout his business experience of fifteen years he had never purchased it, or knew of its being regarded as other than a crude rubber. Similar statements were made by Francis R. Henderson, of Henderson & Korn; Thomas A. Desmond, of Robinson & Co., and G. A. Luddington, purchasing agent of the Fisk and Federal rubber companies and formerly an importer and dealer in crude rubber.

Robert C. Hartong, chief compounding chemist of The Good-year Tire & Rubber Co., said that Jelutong was used solely as a rubber and as a necessary component of some of the compounds prepared by his company. He illustrated this with samples, the compounds being the same except that in one case Jelutong was used in the mixture, while in the other case no Jelutong was used. His testimony clearly established the fact that Jelutong had definite qualities as a rubber, and that those qualities in a rubber compound could be obtained only by the use of Jelutong or a similar rubber.

Ralph B. Naylor, chief compounding chemist of The Fisk Rubber Co., Chicopee Falls, Massachusetts, and James J. Clifford, superintendent of manufacture of the Boston Woven Hose & Rubber Co., Cambridge, Massachusetts, also referred to the necessity of using Pontianak, or Jelutong, as one of the rub-

ber components of many different kinds of rubber compounds, and said that they never used it for any other purpose than as a rubber. Mr. Clifford also showed samples, using other lines of goods than those produced by Mr. Hartong, the combined exhibits including automobile tires, garden hose, rubber shoes, etc.

William G. Hopkins, purchasing agent of the Boston Woven Hose & Rubber Co., stated that since 1905, when he became purchasing agent, he had always bought Jelutong as a crude rubber and had always regarded it as such. He said further that it was carried in the inventories and stock sheets of his company with the other crude rubbers used.

Julian A. Whitcomb was called as a botanist and expert in the growing and preparation of crude rubbers. He illustrated his testimony with sections of an *Hevea* tree and a Jelutong tree. These trees, together with latices of trees of each of these kinds, were imported from the East by L. Littlejohn & Co., Inc. Mr. Whitcomb readily identified both trees, and proved by illustrations of the appearance of the bark and wood, and in other ways, that the trees were what they were stated to be. He introduced samples of rubber which he had prepared by coagulation of the latices from the two different trees, and explained how these rubbers were prepared and how they could be identified by their appearance. He further explained the method of tapping and preparing Jelutong, *Hevea*, *Caucho*, *Landolphia* and other rubbers in their native places, as he had explored and traveled extensively in the Far East, in Africa, Mexico, Central and South America, and also explained the various kinds of Jelutong trees, describing the differences between them, their habitats, their growth, and the method of preparation of the rubber from the latices. Pontianak, he explained, is another term for Jelutong, the name under which the commodity in question had been invoiced; that the word "Jelutong" is derived from the plant from which this rubber comes, and that the word "Pontianak" is the name of a town and district in Borneo from which it is procured, an identical product being imported from British North Borneo and Sumatra. Roger S. Hardy, another expert, corroborated this testimony.

Frederick J. Maywald then testified as to the chemical identity of Jelutong and other rubbers, stating that rubber is the only material that has both plasticity and elasticity and that Jelutong combines both qualities. He explained the method of compounding and curing rubbers, described the differences between various rubbers as to physical qualities, curing time and other characteristics, and told of the qualities imparted by various rubbers to certain compounds. He said that he had an experimental plant and had made a large number of samples of various kinds. Many of these samples were introduced in evidence. He showed samples of both wild and plantation rubber from practically every well-known rubber family. He showed samples compounded with these various rubbers, and explained the various times of cure and proportions of sulphur necessary to bring about the same cure with different rubbers, clearly showing that hardly any two rubbers were identical in their characteristics. He also testified as to Jelutong being regarded, both in the trade and in the literature, as a crude rubber, and mentioned particularly Circular 38 of the Bureau of Standards, Department of Commerce, in which Jelutong is classified as one of a number of rubbers. The witness introduced samples of crude washed and dried rubbers, and some rubbers which had been deresinated, thus showing that the basic component in each case was caoutchouc or rubber gum, and that all were substantially identical. He said further that all

rubbers contain resin, and that the resin content varies, not only as between different families, but also in the same family, when obtained from different sources. He explained the chemistry of the vulcanization of rubber, so far as it is understood at the present time.

The government then called Mr. Montgomery, examiner of chemicals and drugs in the Appraiser's Office, who testified as to the custom in examining Jelutong, and stated that it was his belief that it has been returned as a crude drug. William H. Quinton testified along similar lines for the government, and introduced in evidence invoices of importations of various rubbers, including Jelutong.

H. L. Brown stated on behalf of the government that he was using about 25 tons of Jelutong a year in the manufacture of chewing gum. On cross-examination, however, he admitted that he did not use Jelutong as such, but extracted the resins and used them in chewing gum, selling the remaining rubber to rubber manufacturers. He said further, on cross-examination, that it was not possible to use the untreated Jelutong in chewing gum.

The case was then closed, and both attorneys were ordered to file briefs. The opinion, delivered by General Appraiser Hay for the Board, reviews the testimony as already set forth and concludes:

The above statement of fact would seem to conclusively decide the question at issue.

There is no doubt from this testimony but that the commodity is known throughout the trade of the United States as crude rubber, and, that india rubber and crude rubber are the same thing. Nor is there any doubt from this testimony but that it is used for the same purpose as other kinds of rubber and has the same qualities, the difference being only one of degree. In our judgment the testimony clearly brings Jelutong within the purview of paragraph 513. This conclusion we think is in line with the dictionary meaning of the word, the encyclopedic authorities and such technical authorities as treat of the subject.

The protest is therefore sustained and the collector will liquidate the entry accordingly.

BOARD OF U. S. GENERAL APPRAISERS.

Entry 197,286 returned herewith.

JUDICIAL DECISIONS.

RACINE RUBBER CO. v. INDUSTRIAL COMMISSION, Supreme Court of Wisconsin, May 15, 1917. An employee of the rubber company was seated in a room in the factory at the noon hour eating his lunch, in accordance with a long-existing custom known by and tacitly consented to by his employer, when a large piece of rubber unexpectedly fell on him and broke his leg. He was awarded compensation by the Industrial Commission, and the employer appealed. The Court decided that he had been, at the time of the accident, engaged in service growing out of or incidental to his employment within the meaning of the Workmen's Compensation Act. The award was therefore affirmed, with costs, to the employee. [Northeastern Reporter, Vol. 162, page 664.]

INNER SHOE TIRE CO. v. KNAPP-BROWN CO., Supreme Court of South Dakota, June 26, 1917. The Inner Shoe Tire Co., manufacturer of a lining for tire casings, made an oral contract with the Knapp-Brown people to vulcanize their product into the casings. The manufacturer supplied order blanks and made a shipment on an order written on one of them. They claim that this was an outright sale, while the vulcanizers claim that they acted merely as agents and the goods were shipped on consignment in accordance with the verbal contract and that they were returnable if they were not needed. A judgment in favor of the Knapp-Brown people in the Municipal Court of Sioux City was affirmed by the Supreme Court. [Northwestern Reporter, Vol. 163, page 572.]

THERMOID RUBBER CO. v. BRITSON, Supreme Court of South Dakota, June 26, 1917. The Britson Manufacturing Co. is the

manufacturer of a rubber tread intended to protect tires and prevent skidding. This company bought of the Thermoid Rubber Co. tires and tubes which were to be used in conjunction with its product. These were guaranteed to be the equal of any on the market, but when they were delivered and sold they proved defective. Because they were faulty many of the customers refused to pay for either the tires or the treads. As the treads were extensively advertised the company sustained a great loss and brought suit to recover \$25,000 damages. It was decided that because the Thermoid company could sue the purchasers for the value of the tires, they did not suffer so great a loss. This judgment was affirmed in the Supreme Court. [Northwestern Reporter, Vol. 163, page 567.]

THE B. F. GOODRICH CO. v. SEWELL CUSHION WHEEL CO., Supreme court of Michigan, May 31, 1917. The B. F. Goodrich Co. and its predecessor, the Diamond Rubber Co., for a number of years, manufactured for the Sewell company, rubber cushions used by them in a patented wheel for automobile trucks. The cushions are made of the best grade rubber that could be procured and sold on a five-year guarantee. In October, 1913, an order was placed for some of these cushions, and shipments made to the amount of 979 pounds. It is conceded that the rubber was under-cured and some 800 pounds returned to the factory to be re-cured. The Goodrich people submitted a sample of a part of the rubber which they had re-cured which was satisfactory. When the bulk of the re-cured rubber was returned it was found to be of a poorer quality than that which the Sewell people were used to getting and they could not use it because of the five-year guarantee. They therefore notified the sellers that the goods were held subject to their order. Fruitless negotiations followed and suit was brought in the Circuit Court, where a judgment in favor of the buyer was given and this was upheld by the Supreme Court, with costs to the Sewell company. [Northwestern Reporter, Vol. 163, page 5.]

THE GOODYEAR TIRE & RUBBER CO. v. E. W. WARD AND OTHERS, St. Louis Court of Appeals, May 8, 1917. The Goodyear company sold a bill of goods consisting of tires and tubes to the "New York Motor Car Co." which, it alleges, is composed of E. W. Ward, Oscar J. Mueller and Adolph Grohe. When the case was first tried before a justice of the peace, he decided that there was no cause for action against Mueller. In the Court of Appeals evidence was introduced which showed that Mueller had signed a contract for the sale of automobiles with the Elmore Manufacturing Co. and had shared the profits on sales made under the agreement with the other members of the firm. He, however, did not share in the profits of the repair department, which was run in the name of the firm, but he used part of the goods sold to pay the rent of the firm's office. It was therefore decided that he was responsible for the debt with the others and the case was remanded for further trial. [Southwestern Reporter, Vol. 195, page 75.]

DOOLITTLE v. SAVAGE TIRE CO., District Court of Appeals, Second District of California, April 19, 1917. M. G. Doolittle was employed by the tire company as a salesman and made an agreement with the sales manager to use his automobile in connection with his work, for which use he was to receive a reasonable compensation. He used the machine from the beginning of August, 1913, until the end of August, 1914. In March, 1914, a new arrangement was made whereby the company supplied the gasoline. Evidence showed that the value of the use of the automobile was \$100 per month if he supplied the fuel and \$75 a month while it was supplied to him. Thus the total value of the use of the machine figured about \$1,000. Suit was brought in the Superior Court and judgment found for that sum. The company appealed but the judgment was affirmed. [Pacific Reporter, Vol. 165, Page 728.]

MILLER v. HARVEY, Court of Appeals of New York, May 22, 1917. The general rule which concedes the delivery of goods, in

this case automobile tires, to a common carrier as a delivery to the buyer, has an exception where the goods which were bought and paid for, were delivered to the express company and the seller neglected to state their value, \$95.43, which neglect limited the liability of the express company to but \$50. The tires were lost in transit and the buyer requested a second shipment which was made. A suit was brought by the seller for the value of the delivered goods. It was decided that the buyer was entitled to the second shipment. The seller appealed but the judgment was affirmed. [Northeastern Reporter, Vol. 116, page 781.]

In re GIBNEY TIRE & RUBBER Co., United States District Court, Eastern District of Pennsylvania, May 7, 1917. In an involuntary proceeding in bankruptcy based on the bankrupt's admission in writing of its inability to pay its debts and its willingness to be adjudged a bankrupt, an adjudication was made within five days after the return day of the subpoena, which are allowed under the provision of the Bankruptcy Act, and creditors, who had not then intervened, subsequently filed a petition to vacate the judgment and permit them to defend, alleging only the solvency of the bankrupt. It was held that, while such solvency would not prevent a judgment on the ground upon which the proceeding was based, this was not a sufficient reason for refusing to vacate it, as creditors seeking the vacation of a judgment prematurely entered are not required to show facts constituting a good answer to the bankruptcy petition, and their allegation as to solvency was not intended to serve as an answer, but to show a substantial right on their part to intervene. [Federal Reporter, Vol. 241, page 879.]

RUBBER TRADING CO. v. MANHATTAN RUBBER MANUFACTURING Co., Court of Appeals of New York, June 5, 1917. The Manhattan Rubber Manufacturing Co. agreed to buy 15 tons of prime thin Maniçoba rubber at \$1 a pound, delivery to be made about five tons a month in September, October and November, 1912, and billed on a credit of ten days. The first delivery made under this contract was made in August and paid for in September without previous inspection. Defects were found and 7,900 pounds were returned with the consent of the importers. When the second shipment arrived in October, the buyers were notified and asked to examine the rubber while on the dock or in the warehouse, and they refused to accept the rubber until it could be put through a test at their factory. The Trading company refused to issue delivery orders until they received the acceptance. The other shipment arrived in November and neither party would recede from its position. Each party notified the other that the contract had been broken. Part of the rubber was sold at a reduced price and the rest was retained. Action was brought to recover the profit which had been lost. Judgment was found in favor of the sellers, and upheld by the Appellate Division of the Supreme Court, but when taken to the Court of Appeals it was reversed and a new trial granted, with costs to abide the result. [Northeastern Reporter, Vol. 116, page 789.]

MASTER TO EVALUATE MUNGER RIM PATENT.

In an unusually detailed interlocutory decree, Judge Manton has appointed James J. Kennedy, of New York City, as master to go over the books of the Perlman Rim Corporation and determine how much Louis DeF. Munger should receive in back royalties on his patent as a result of winning his recent infringement suit. The decree contains the specific instruction that the master is to "consider the nature of the invention, its utility and the advantages to be gained from its use" as a basis for determining the rate of royalty. The task of evaluating the patent itself is best measured by the fact that the whole industry has not yet been able to do so. It is one that will probably take many months to accomplish, and further delay will be occasioned by the fact that all is contingent upon the recent decision being upheld on appeal.

TRADE-MARK DECISIONS.

COLOR NOT REGISTRABLE AS A TRADE-MARK.

DECISIONS of the Commissioner of Patents regarding the registration of trade-marks of rubber goods of special interest to manufacturers, are to the effect that color of the goods is not sufficiently distinctive to be allowed as a trade-mark. In the case of *The B. F. Goodrich Co. v. Firestone Tire & Rubber Co.*, 123 Ms. Dec. 60, May 22, 1917, opposition was filed to the registration of a mark for tires, consisting of a circumferential band of black, between two circumferential red bands. Opposer used a black tread for its tire, with side walls of gray. The commissioner decided that it makes no difference whether the marking was for purposes of ornamentation, or as a trade-mark. The color scheme is not distinctive enough for a trade-mark and cannot, therefore, be monopolized.

In an opposition filed against the preceding mark—*Lee Tire & Rubber Co. v. Firestone Tire & Rubber Co.*, 123 Ms. Dec. 62, May 22, 1917—opposer claimed it first used red sides with a gray tread for tires. The making of sides and tread of different color is functional, because the parties agree that different rubber should be used in the different places, as they are of different color. The opposition is sustained.

In an opposition to the registration of the same mark—*Good-year Tire & Rubber Co. v. Firestone Tire & Rubber Co.*, 123 Ms. Dec. 63, May 22, 1917—opposer claimed he used a central circumferential band of blue. There is no valid trade-mark in coloring an automobile tire to be one color on the sides and another on the tread, regardless of what the colors are. It is not only not distinctive, but the making of sides and tread of different color is functional. There is no trade-mark in a device that depends on color to distinguish it. This case is distinguished from cases where a design is distinctive apart from the color. Color is not definitive in any case; there are innumerable shades of any color. The proposed registration would give a group of applicants a monopoly of the natural and practical designs for ornamenting a tire to distinguish it from other tires. Distinctiveness of a mark must rest in something not equally open to use by others.

An opposition to application to register a black and red combination of color for tires—*Firestone Tire & Rubber Co. v. Goodrich Co.*, 123 Ms. Dec. 68, May 22, 1917—was dismissed, on the ground of prior use of gray and black colors by the applicant. However, the mark is not properly registrable and should be rejected.

An opposition filed to the foregoing mark on the ground of prior use of a black tread and red sides by opposer—*Miller Rubber Co. v. Firestone Tire & Rubber Co.*, 123 Ms. Dec. 66, May 22, 1917—was sustained, for the reasons given in the preceding decision.

The case of *L. Candee & Co. v. Hood Rubber Co.*, 123 Ms., Dec. 78, is a petition to cancel a trade-mark applied to rubber boots and shoes, consisting of a gray band encircling the top of the articles. Petitioner having shown prior use, it is immaterial whether the mark was structural or for ornament, or as a trade-mark for the particular goods. Whatever significance the band had in one case, it has in the other. If functional with the petitioner, it is so for applicant, and the mark is therefore not registrable. Color is not distinctive, in any case, and such a mark is fundamentally improper. The mark is, therefore, properly cancelled.

A STRIKING COMPARISON APPEARS IN A REPORT OF THE COMMISSIONER OF Patents, in a recent decision considering the application of a trade-mark for rubber goods. He says, "There is no such thing as a general trade-mark, any more than there could be such a thing as one twin."—Well, that isn't an impossibility. Perhaps you know somebody who is one twin. We do. His brother is dead.

What the Rubber Chemists Are Doing.

THE PREPARATION OF RAW RUBBER.

THE preparation of raw rubber with special reference to "Slab" rubber and variability is discussed by B. J. Eaton in the Agricultural Bulletin of the Federated Malay States (February and March, 1917). The following questions have been raised in connection with what has been termed by Eaton "Slab" rubber; that is, unpressed, or lightly pressed or rolled coagulum.

1. Does the preparation of this type of rubber lead to greater variability or uniformity? Is it a solution of the problem of uniformity?

In the opinion of the author the preparation of this type of rubber will tend toward greater uniformity than exists at present. Putting aside the preparation of pale crêpe, which may be considered from the point of view of its uses a special preparation, it is proposed to substitute "slab" rubber for sheet, so that variability has to be considered, principally as between slab and sheet. It has been shown that the cause of variability in rate of cure is due chiefly to biological agencies, acting on the protein constituents of the rubber, producing substances of the nature of amines or amino acids which act as vulcanization accelerators, and that numerous variable factors in methods of preparation affect the amount of such accelerators which are formed. It is obvious that the more variable factors the greater the variability of the product. The author holds that greater variability is introduced in sheet than in "slab" rubber, which undergoes the minimum of handling. One of the greatest factors responsible for variability in rate of cure of sheet rubber is the rate of drying, including smoking, and, secondly, the concentration of the latex and the amount of rolling.

Since the primary cause of variability in rate of cure is biological, it may be thought that considerable variability would be caused by an uncontrolled fermentation or decomposition, such as occurs in coagulum. It should be remembered that in this country (Malaysia) the shade temperature is very constant during the day and this constancy, in the author's opinion, is responsible for the remarkable uniformity of the change which takes place in unrolled coagulum left to mature for six days, together with the fact that the latex during collection is thoroughly exposed to numerous chance organisms which enter it. This remarkable uniformity of "slab" rubber has been proved by the writer, not only in all his experimental samples, which include many hundreds, but also in samples prepared on different estates in various parts of the country.

2. Is slab rubber, apart from the advantage to manufacturers of its rapidity of cure, of better quality than other first-grade types?

All our experiments have shown that the tensile properties of "slab" rubber are from 20 to 25 per cent better than those of crêpe rubbers and generally superior to sheet rubber, and since sheet is superior to crêpe in general, it may almost certainly be argued that the keeping properties of vulcanized "slab" rubber will also be superior. The superior tensile properties of "slab" rubber may be either an inherent quality of the raw rubber, or due to the much shorter time of vulcanization required for its optimum cure and maximum tensile properties.

There are thus two advantages in favor of "slab" rubber—rapidity of cure and superior tensile properties.

3. Will ultimate manufacturing difficulties be likely to be greater than those which exist with present types of first latex plantation rubber?

There is absolutely no reason why the preparation of "slab" rubber should cause greater confusion or difficulty for the manufacturer than is caused by the variability in rate of cure which exists at present in the case of sheet and crêpe rubbers.

In demonstration the author cites the fact that a large American concern on its Malaysian plantation prepares "slab" rubber for use in its own factories in America.

4. In what form should slab rubber be shipped, having in view the extra freight on wet rubber?

There are only three forms in which "slab" rubber can be placed on the market, as follows: (a) Virgin slab containing about 20 per cent of moisture, (b) as dry crêpe, (c) as block.

The first form necessitates payment of freight on water to practically the same extent as in the case of Fine Hard Para, which does not appear to cause any difficulties on the market.

The advantage of converting slab to crêpe on the estate is that freight on moisture is eliminated. It is doubtful whether the advantage in favor of marketing this type of rubber in the form of crêpe is sufficient to neutralize the disadvantage of shipping virgin "slab."

The third form in which this type of rubber can be marketed is dry block made from artificially dried crêpe. At the present stage no definite statement can be made as to which of the three forms will eventually prove the most satisfactory, although in the author's opinion, shipping in the form of virgin "slab" or dried block is preferable to conversion to crêpe on the estate and shipping as crêpe.

The company referred to as shipping "slab" rubbers from its estates packs it in bags only.

The author expresses his opinion that the "slab" type of plantation rubber is of considerably greater value than the types of plantation Para rubber at present on the market and also is superior to Fine Hard Para.

GLYCERIN SUBSTITUTES.

An efficient glycerol substitute by J. Lennox is reported as follows in "Chemical Abstracts." The formula yields a product which has body, a sweetish taste and is reasonably permanent. Irish moss (washed) 0.5 ounce; water, 24 fluid ounces. Keep at boiling temperature in a covered vessel for 15 minutes, strain the mixture with pressure, pour upon the muslin boiling water, make up to 19 fluid ounces; then add glucose one ounce, mix and strain through double ply without pressing.

The drug trade is using a sugar syrup as a substitute for glycerin. Its composition is invert sugar 46.8 per cent, sucrose 29.35 per cent, ash 0.05 per cent, water 23.8 per cent. This material would probably be found valueless in connection with rubber work where glycerin is employed.

SUBSTITUTE FOR RUBBER.

Sterilin is suggested as a substitute for rubber finger cots for medical examinations. It fits the finger well, does not affect the touch, is washable with soap, and can be disinfected with lysol and corrosive sublimate. It cannot be sterilized in steam. [A. Pinkus, Berlin, through "Chemical Abstracts."]

ANTIMONY AS TRISULPHIDE.

The following method for the determination of antimony as trisulphide, by C. B. Clark, is based on the fact that antimony trisulphide can be converted into the black crystalline modification by passing hydrogen sulphide into the hot liquid containing a large excess of hydrochloric acid. In practice the solution of the antimony salt is heated with 24 to 100 cc. hydrochloric acid on a water bath, and frequently shaken while a current of hydrogen sulphide is passed through it. The conversion of the sulphide into the black form will be completed after 30 to 35 minutes. The precipitate is collected in a Gooch crucible, washed with water and alcohol, and dried at 270 to 280 degrees C. in a current of carbon dioxide.

The sulphide is convertible into pentoxide by ignition with a weighed quantity of ferric oxide and ferric nitrate.

CHEMICAL PATENTS.

THE UNITED STATES.

RUBBER COMPOSITION. A flexible rubber composition is made by disintegrating vulcanized fibrous rubber waste, mineral oil or other oily matter which prevents too fine reduction of the fibers. The disintegrated mass is mixed with sulphur and then subjected to heat and pressure to revulcanize the rubber. [F. T. Lahey, United States patent No. 1,233,252.]

THE UNITED KINGDOM.

RUBBER SUBSTITUTES. A substitute for rubber is made from a mixture of 24 parts gelatine or glue, 28 parts glycerol, glucose or molasses, 10 parts water, 8 parts each rubber, zinc oxide, and diatomaceous earth or whiting, 5 parts of sulphur, 3.5 parts calcined magnesia, 2.5 parts litharge, 2 parts formaldehyde, potassium bichromate, tannin or like toughening agent, and 1 part coloring matter. Calamine, Pontianak, asphaltum, coal tar or pitch, or like softening agent may be employed as substitutes for the gelatine or glycerol. The mixture is subsequently molded and vulcanized. It may be used as an inner core for tires, for electric insulation, tilings, roofing, etc. [J. Flint, British Patent No. 105,912.]

LABORATORY APPARATUS.

MOISTURE TESTER.

THE accompanying illustrations show an instrument in the form of a weighing scale for the determination of moisture in dried material. The instrument was designed for use in connection with the kiln drying of lumber, but is equally well adapted for any material the moisture content of which is desired. The instrument is simple and direct, reading requires no figuring. It

is accurately made, graduated to the metric system and can be used for ordinary weighing. To determine the amount of moisture in crude rubber, for example, a specimen is selected

and weighed as received; it is then completely dried by any suitable means, preferably vacuum dried for speed, and weighed again immediately. Following the chart line from first weight

to percentage scale at final weight will give the moisture content. The instrument has already found a place in the rubber industry. It is known as a lumber tester because of its initial adaptation. [Grand Rapids Veneer Works, Grand Rapids, Michigan.]

WATER-STILL.

Absolutely pure water in laboratory practice is a necessity that is too well known to warrant comment. The obvious practicability of the apparatus here illustrated will make the following brief description of interest.

The Ralston water still is a simple and convenient piece of apparatus suited for laboratory use. The still is made of copper coated with pure block tin. It can be operated by an ordinary gas burner; size, 14 1/4 inches high and 9 1/4 inches diameter with a capacity of one quart per hour. [John Trageser Steam Copper Works, New York City.]

THE NEED OF STANDARDIZED TEST PIECES.

Standardization is now the order of the day and is particularly important in testing materials of every sort, if the results are to be so correlated as to benefit the entire industry concerned. In the manufacture of rubber goods the tensile strength of the

vulcanized product is commonly determined by stretch or breaking tests, yet the conditions under which these tests are made vary so greatly that exact comparison is virtually impossible and their full value is consequently not obtained. European testing machines as a rule call for rings, while the American specify strips, and unfortunately no uniformity exists with respect to the cross section, length and shape of the latter. Many factories would gladly revise their methods by the adoption of a standard practice were such available, and rubber technicians can do the industry a service in threshing out this matter and making recommendations.

It is the custom of the Bureau of Standards and several manufacturers of rubber goods to cut 1/4-inch test pieces from vulcanized sheet 3/32 inches thick, the specimen having enlarged ends shaped as indicated in Fig. 1, and the elongation in the tension machines being taken between the 2-inch marks shown. Specimens of similar shape 6 1/4 inches long and 1/2 inch wide between the 2-inch marks, as shown in Fig. 2, are also in common use by certain manufacturers. Some firms die their test pieces out of 1/8-inch sheet, some prepare them by molding rather than cutting, and, generally speaking, there is an unfortunate lack of uniformity in shape and dimensions. The length of the straight part varies and the same may be said of the curves and other sections of the pieces, many factories having adopted their own patterns.

It is already conceded that strip tests do not involve certain

errors to which the ring is subject; also that greater uniformity throughout the narrow portion is had by punching away the sides of a flat strip of rubber sheet with a suitable die in a punch press, leaving the test portion between two stout ends for engagement by the grips of the testing machine, than by molding the specimens, careful as must the cutting be done to insure clean edges, as a tear will readily follow a slight check. There seems to be virtual agreement that the rate on tensile tests should be at 20 inches per minute movement of the stretching clamp, but beyond the three foregoing points uniformity ceases.

While the two sizes and shapes already illustrated and dimensioned are more commonly employed than any others, die makers are manufacturing a great variety of dies, mostly for use by mallet on a cutting block, but also plain tops for use under ordinary cutting presses and various forms of tops for insertion in other styles of presses. The straight part in the center of all is either $\frac{1}{4}$ or $\frac{1}{2}$ inch in width, but its length varies, as do also the curves of the grip ends where they reduce to the definite cross section of the sample. Both call for standardization, as Dr. Albert A. Somerville states that these curves have considerable influence on the test.

Here, indeed, is opportunity for scientific research, consultation and recommendation. It would seem that one of the two specimen shapes and sizes shown, together with a specified thickness, might meet the requirements, yet possibly a still better substitute might be evolved.

CHEMICAL ENGINEERS TO MEET IN BOSTON.

CHEMICAL engineers and manufacturers from all over the United States will gather in Boston on September 10, 11, and 12, to participate in the fifty-fifth annual convention of the American Chemical Society. It is estimated that over a thousand will be present for the event, in spite of the fact that many will be compelled to remain at home on account of war orders and the development of war time plans and experiments. It was intended that the convention would occupy the entire second week of September, but it has been determined on account of the serious times and the mobilization of militia during that month, to eliminate such features of the convention as the big banquet and other entertainments, excepting that a typical New England Shore dinner and a smoker will give the desirable touch of good-fellowship to the event.

The meetings will be held in the buildings of the Massachusetts Institute of Technology, Charles River Road, Cambridge.

Registration will be conducted at the buildings of the Massachusetts Institute of Technology, Cambridge, except on Monday, September 10, when it will be held at the Hotel Lenox.

Society headquarters will be at the Hotel Lenox at the corner of Boylston and Exeter streets.

The use of the Engineers' Club, at the corner of Arlington street and Commonwealth avenue, will be extended to all members of the Society.

The program is characterized by simplicity and seriousness, and bears as fully as possible on questions concerning the activities of chemists—both in the government service and in the industries during the war.

GENERAL PROGRAM.

Monday, September 10.

4.00 p. m., Council Meeting. Engineers' Club.

7.00 p. m., Dinner to the Council at the Engineers' Club (tendered by the Northeastern Section).

Tuesday, September 11.

10.00 a. m., General Meeting of the Society in the Massachusetts Institute of Technology.

Address of Welcome:

Dr. R. C. MACLAURIN, President Massachusetts Institute of Technology.

Response:

JULIUS STIEGLITZ, President American Chemical Society.

General Papers.

2.00 p. m., General Conference on Chemistry and Chemistry in Warfare, opened by WILLIAM H. NICHOLS, Chairman Committee on Chemicals, Council of National Defense. MARSTON T. BOGERT, Chairman Chemistry Committee, National Research Council.

5.00 p. m., Harbor trip to Hotel Pemberton, where an informal shore dinner and smoker will be held.

Wednesday, September 12.

Morning, Conferences of Divisions.

Afternoon, Divisional Meetings.

Evening, President's Address, Huntington Hall, Rogers Building, Massachusetts Institute of Technology, Boylston street.

Thursday, September 13.

Morning and Afternoon, Divisional Meetings.

ANNUAL MEETING OF THE RUBBER SECTION.

While the exact date has not been fixed, this meeting will probably be held on either September 12 or 13. The final program for the Rubber Section meeting will probably not be ready until about September 1, but the following tentative program will give some idea of the scope of the meeting:

Reports from the Chairman and Secretary on the work of the Rubber Section.

"A Volumetric Method for the Determination of Free Sulphur," by E. H. Johnson and H. S. Upton.

"The Direct Determination of India Rubber," by John B. Tuttle and Louis Yurow.

Symposiums:

The Best Methods for the Determination of Free and Total Sulphur.

The Use of Accelerators in the Vulcanization of Rubber.

The Rubber Chemist in the National Service.

A number of chemists have already promised to attend the meetings and enter into the discussion of these subjects, among others, L. E. Weber, E. H. Johnson, H. S. Upton, J. B. Tuttle, L. J. Plumb, C. R. Boggs, and D. Spence. Others who have been invited to speak include H. C. Pearson, W. C. Geer, Dorris Whipple, R. S. Postmontier, E. A. Barrier, Frederic Danerth, Earl Davis, Bertrand H. Hale, R. T. Stokes, J. P. Millwood, Donald Cranor and W. H. Cobb. Many of these men will be able to arrange matters so as to be present, and in that event will undoubtedly take part in the discussion. Dr. Spence is chairman of the sub-committee of the National Research Council on Rubber and Allied Products, and we are particularly eager to hear from him just what assistance the rubber chemist can be in the service of our country during the present crisis.

The object of the present announcement is to urge all of the rubber companies to see that matters are so arranged that their chemists will be able to attend this meeting. Everybody appreciates the value of rubber in modern warfare, but the fact remains that while we may have sufficient rubber for our needs, there is still a lot to be done in the way of standardization of supplies and equipment in such a fashion as to make the best possible use of our raw material. It is an assured fact that anything which the rubber chemists can do to be of assistance to the government in this matter will prove to be a valuable service, and one which it is both our duty and privilege to perform.

Last year, more than 100 rubber chemists attended the meeting of the Rubber Section in New York, and they were practically unanimous in expressing their opinion that the meeting was a most profitable one, and well worth attending. There is

no reason why this meeting should not be even better than the last. There is nothing which so tends to quicken our interest and increase our efficiency as meeting with our fellow chemists and exchanging ideas. The fact that every one is so busy is just the reason why we should take this opportunity of getting together and discussing subjects of vital importance to ourselves, our work, and our country.

The secretary has already received some names of those who wish a copy of the final program sent to them when it is issued, but if there are any others who also would like to have a copy it will be well for them to send in their names at once, since pressure of other matters in connection with his government work may render it impossible to comply with such requests if received at the last moment.

John B. Tuttle, Secretary,
Bureau of Standards,
Washington, D. C.
August 18, 1917.

L. E. Weber, Chairman,
729 Boylston street
Boston, Massachusetts.

A MEMORIAL TO JOSEPH PRIESTLEY.

The rubber industry will welcome the plan of the American Chemical Society to raise a fund of \$2,000 for a suitable memorial to Joseph Priestley, the English-American scientist and writer who discovered oxygen and gave caoutchouc the name rubber because it will erase pencil marks. It is proposed to secure a copy of the best available bust portrait to be deposited as a loan in the National Museum, Washington, D. C., and at intervals of a year or more to award Priestly gold medals for superior achievement in chemical research. The matter is in the hands of a notable committee of fifteen, of which F. C. Phillips, University of Pittsburgh, Pittsburgh, Pennsylvania, is chairman. Contributions from \$1 upwards are solicited.

THIRD NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES.

It is the belief of those in charge of the Third Annual National Exposition of Chemical Industries, which will be held at Grand Central Palace, New York City, during the week of September 24, that the affair will be the greatest ever held.

Monday, September 24, at 2 p. m., opening addresses will be made by Dr. Charles H. Herty, chairman of the advisory committee of the exposition and editor of the "Journal of Industrial and Engineering Chemistry;" by Professor Julius Stieglitz, president of the American Chemical Society; Dr. Colin G. Fink, president of the American Electrochemical Society, and Dr. G. W. Thompson, president of the American Institute of Chemical Engineers.

Among the speakers on the program for other days are W. E. Kies, vice-president National City Bank, "The Development of Export Trade with South America"; Professor Marston Taylor Bogart, chairman chemistry committee National Research Council, "The Operation and Work of the National Research Council for the National Weal"; Dr. L. H. Baekeland, of the Naval Consulting Board, "The Future of American Chemical Industry."

In a symposium on "National Resource as Opportunities for Chemical Industries" the speakers will include C. H. Crawford, assistant to president of Nashville, Chattanooga & St. Louis Railway; V. V. Kelsey, chemist-industrial agent Carolina, Clinchfield & Ohio Railway; Dr. E. A. Schubert, mineralogist-geologist Norfolk & Western Railway; Dr. T. P. Maynard, mineralogist-geologist Central of Georgia Railway and Atlantic Coast Line Railway, and Dr. J. H. Watkins, geologist Southern Railway.

The motion picture program will be one of wide interest. The American Cyanamid Co. and General Electric Co. have already arranged to supply their films. The Bureau of Commercial Economics at Washington will also supply many toward completing the range of industrial films.

The purposes of the exposition are not so much to show the progress made in all the chemical industries as to indicate where progress can be made, and where opportunities await development, and how our national resources and wastes can be made valuable and useful. It gives the man of science, the financier, manufacturer and plant operator the opportunity of personal contact with the latest machinery, materials and products used and applied in all the chemical industries, and the opportunity of learning how they can be applied to his specific purposes.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

[320.] Manufacturers of elastic garter webbing are sought.

[321.] A correspondent seeks information on a method for compounding rosin to take the place of shellac.

[322.] An inquiry has been received for a machine for applying labels to cartons.

[323.] A concern that buys uncured friction reclaim is sought.

[324.] Names and addresses of manufacturers of small laboratory centrifuges for latex coagulation have been requested.

[325.] An inquirer desires to secure machinery for making rubber bands.

[326.] A correspondent wishes to be put in touch with a manufacturer of cellulose acetate.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

A mercantile and manufacturing company in Italy desires to purchase imitation leather valises. Report No. 25,019.

A merchant in Newfoundland wishes to purchase rubber protectors, rubber tissue, and other haberdashery used in the tailoring business. Report No. 25,110.

A firm in the United States representing a company in Spain is in the market for rubbers and overshoes. Report No. 25,113.

An agency for the sale of suspenders and garters is sought by a firm in India. Report No. 25,127.

An applicant in Algeria wishes to purchase rubber erasers and bands. Report No. 25,144.

A company in Brazil is in the market for low-cut rubbers for men. Report No. 25,148.

Representation of American manufacturers of all kinds of artificial leather is desired by a merchant in Australia. Report No. 25,187.

A manufacturers' agent in Newfoundland wishes to secure an agency for the sale of fine rubber goods in soft and hard rubber, mechanical rubber goods for railroads, etc. Report No. 25,206.

A firm in British East Africa wishes to buy bicycle tires 28 by 1½ inches, with a straight ribbed tread running with the tire; 4,000 to 5,000 of these tires can be used annually, as well as inner tubes for same. Report No. 25,227.

A firm in Brazil wishes to represent American manufacturers and exporters of rubber goods and textile machinery. Report No. 25,238.

AFRICAN RUBBER AVAILABLE.

A consular officer in British East Africa reports that several concerns in that country are prepared to furnish rubber in specified quantities for shipment to the United States. American concerns interested may secure the names and addresses of such firms from the Bureau of Foreign and Domestic Commerce, or its district or cooperative offices, by referring to file No. 91,462.

New Machines and Appliances.

THE BANBURY AUTOMATIC MIXER.

PROGRESSIVE builders of rubber machinery are constantly studying the rapid advancement of rubber mill practice with the object of developing the necessary machines that will meet

the mechanical requirements of present-day methods. That such inventive effort has been productive in evolving a mixing machine of novel design and proven efficiency is shown in the accompanying illustration.

This machine is adapted to break down the rubber and mix the compounding ingredients at the same time; in fact, it is capable of performing the work usually done on the 48-60 and 84-inch, two-roll mixing mills. It is es-

entially an enclosed machine, comprising two revolving blade shafts that rotate in individual cylindrically-shaped troughs, the bottom of which forms a door through which the finished stock is discharged. The stock is kept under pressure by a weight that is controlled by the vertical shaft and ram located above the feed hopper, thus assuring uniform feeding during the mixing operation. The mixer may be driven by direct gearing from the mill shaft or by individual motor drive, and in some cases chain drive is preferred.

In operation the rubber and compounding ingredients may be dumped into the machine while it is running. However, with some compounds it is preferable first to break down the rubber and then add the ingredients, the subsequent action of the machine being entirely automatic. When the batch is thoroughly mixed, the bottom door is opened and the load is automatically discharged, the mixer being ready for the next batch within a fraction of a minute.

Uniformity of product is the principal advantage claimed for this machine as it will always do an equal amount of work for the same number of revolutions, that is to say, for the same time. It is the machine and not the operator that controls the actual mixing operations. Another advantage due to the enclosed construction of the machine is that of cleanliness when compounds containing lampblack or gasblack are milled. [Birmingham Iron Foundry, Derby, Connecticut.]

SOUTHWARK QUICK OPENING VULCANIZER DOOR.

The accompanying illustration shows a new vulcanizer door of the quick opening type that possesses, in connection with unusual facilities for easy handling, the quality of being explo-

sion-proof. In the old type vulcanizer head provided with swinging bolts, should a few of these bolts become loose, as often happens, the other bolts are thrown out by the internal pressure and the door opens violently, causing an explosion. The locking mechanism of the Southwark door, however, is of the breech-lock type and constructed so that when the cover is shifted the taper on the lugs lifts the lid sufficiently to admit air, thus preventing the possibility of an explosion.

The door is opened quickly with very little effort, by means of

a rack and pinion mechanism that is operated by one man and shown in the illustration. Connections are provided in the head for attaching temperature and pressure gages.

All castings are made from open hearth steel and the dished part of the door is boiler plate.

Where vulcanizer doors of the swinging bolt type are used, this style of door can easily be installed by making a special locking ring which may be bolted to the existing ring that is riveted to the shell. [Southwark Foundry & Machine Co., Philadelphia, Pennsylvania.]

THE HOLMES OVERFLOW TRIMMER.

The labor expense connected with trimming the overflow from mechanical rubber goods is an item of considerable importance where large quantities of standard goods are made. The operation

should be quickly and accurately performed and in this respect the trimmer here shown is fully guaranteed by the makers.

The machine is of the foot-power, punch-press type adapted to be mounted on a bench or table. It is especially designed for trimming small mold work, such as fuller balls, disks, bumpers and articles of regular or irregular shapes. The question of accuracy in trimming is definitely de-

termined by the use of punches and dies that are carefully constructed to conform to the shape of the article to be trimmed. The construction and simplicity of the press permit the turning out of a maximum product by an operator of ordinary skill and intelligence. [Holmes Brothers, 500 South Peoria street, Chicago, Illinois.]

THE PRUDEN POWDERED COAL CARBURETER.

The fuel problem is one that is now forcibly being brought to the attention of industrial executives the world over. With the price of coal reaching abnormal levels, the large consumers are confronted with greatly increased cost of power production. The solution appears to be in the use of low-grade coals and to that end a mechanical device for the utilization of powdered coal has been evolved.

In the mechanical application of the Pruden carbureter, the air and powdered coal are intimately mixed and the mixing

intensified in its travel through the burner to the combustion chamber of the furnace. Here the chemical combination of the oxygen of the air and the fuel elements of the powdered coal takes place, resulting in perfect and instantaneous combustion.

The engineering problem of the adaptation of powdered coal as a fuel to a particular plant is first worked out by specialists in a research laboratory by means of a demonstration plant provided for that purpose. The results thus obtained establish on a proven basis the equipment and installation required. [Powdered Coal Engineering & Equipment Co., 2401-21 Washington boulevard, Chicago, Illinois.]

THE STRATTON STEAM SEPARATOR.

The Stratton steam separator shown in the accompanying illustration is designed for the removal of water from steam, and it is particularly recommended to rubber manufacturers for use on the steam inlets of vulcanizers.

This separator utilizes centrifugal force as the means of separating the water from the steam. As the steam and water enter the separator they are caused to pass through a spiral path formed about a central core. The sudden change from a straight line flow to this spiral path imparts a whirling motion to the steam and water. Water is 200 or 300 times heavier than steam, and therefore does not turn corners as easily. At any turn the centrifugal force throws the water against the wall forming the bend, while the steam makes the turn and goes on without the moisture. With a properly formed bend, large or small quantities of water will swing out of the curving steam current, meet the wall at an angle, and slip smoothly along without the slightest spatter or splash, following closely to the wall until the motion dies out.

Thus complete removal of water from the steam is secured and

the vulcanizer receives only dry steam. [The Driscoll-Russell Co., 90 West street, New York City.]

THE BOLTON VERTICAL BIAS CUTTER.

Bias fabric cutting machines are very important and most necessary in the making of various rubber goods, particularly in the manufacture of pneumatic tires, footwear and mechanical goods. The standard, horizontal bias-cutter is the type generally used in cutting the strips of frictioned fabric that are used in rubber goods manufacture. As a radical departure in design, construction and operating principle the vertical machine here illustrated presents a variety of

novel and interesting features. In operation the roll of frictioned fabric is placed in the take-off bearings arranged at the back of the machine and the end of the fabric is run between the tension rollers while the liner is wound up on a power driven roller provided for that purpose. The fabric is then passed over the feed roller at the top of the machine and down the front

to the diagonal clamping and cutting device shown in the front view of the machine and which may be adjusted to any required angle. The cutting is performed by a shuttle-like knife that is reciprocated by a rack and pinion gearing driven from the main shaft. As the fabric is intermittently advanced a predetermined distance by the top feed roller the fabric is firmly held by the clamping device while the reciprocating knife cuts off the strips in successive regularity. The machine occupies a very small floor space. In fact a machine to cut 60-inch cloth on a 60-degree angle occupies a space of 9 feet by 5 feet with head room of 14 feet and requires no foundation for its support. Its accuracy is guaranteed and the cutting knife may be changed within a few moments. Two men are required for its operation. [The Gutta Percha & Rubber Manufacturing Co., 126-128 Duane street, New York City.]

MACHINERY PATENTS.

DEAD WEIGHT MOLD PRESS VULCANIZER.

TO avoid the possibility of excessive pressure in mold curing and the consequent damage to the molds is the principal object of the invention here illustrated. The machine is shown in vertical section with a few molds in position between the platens. Two standards *A A* rigidly support the bottom platen *B*, while the movable upper platen *C* is raised and lowered by two vertical screws *D D*, geared by miter gearing to the shaft *E*, driven by motor *F*, both platens being chambered for steam. The end lugs of the upper platen are provided with square holes and loosely fitted to the square brass nuts that are threaded on the vertical screws. The bottoms of the nuts are flanged to engage the under sides of the lugs.

To raise the upper platen the belt-crank lever *G* is pulled down, starting the motor, the brass nuts are advanced by the revolving vertical screws and the flanges of the nuts engage the lugs, thereby raising the platen. Connected to the lever *G* is a sliding rod *H*, provided with two stops, the purpose of which, briefly stated, is as follows: When the platen is free from the molds the upper stop contacts with a projection on the lug, thereby raising the starting lever and stopping the motor. When the starting lever is raised the motor reverses and the platen is lowered until it rests on the molds. By this time the lug projection has come in contact with the lower stop, thereby lowering the starting lever and stopping the motor. Thus it will be seen that the platen rests on the molds with its own weight, the molds being all of the same thickness and the platen of sufficient weight to afford the required pressure. [Christian Hamilton Grey, Essex, England. United States patent No. 1,234,330.]

FABRIC BAND STRETCHING AND COATING MACHINE.

A band of fabric is formed, compressed, stretched and coated with rubber solution in a heated vacuum chamber and finally passed through a cooling chamber, according to this invention.

The band enters through an automatically closing gate *G* and passes out through the double gate *H*.

Rubber solution is applied to the band through nozzles *I* and *J* from solution tanks *K* that are provided with weighted pistons for positive feeding. Adjacent to each drum are scraping devices *L* that remove the surplus rubber. The band is passed through a cooling chamber, not shown, in which a blast of air cools and hardens it so that it may be handled. [Lawrence A. Subers, East Cleveland, Ohio, United States patent No. 1,234,704.]

RUBBER SOLE VULCANIZING AND EMBOSSEING APPARATUS.

In this invention rubber soles are subjected to both heat and pressure in a vulcanizer and at the same time the design is imprinted on the tread surfaces of the soles. Referring to the illustration, which is a cross section of the apparatus, *A* represents the vulcanizer, and *B* a removable table formed with a hollow chamber that is connected to an exhaust pump by pipe *C*. The upper part of the table is provided with engraved outlines forming the tread designs and the shapes of the soles, one of which, *D*, is shown in place. Connecting channels in the design molds communicate with air ducts *E* that open into the hollow chamber of the table.

When the soles are placed in the vulcanizer and alined with the design molds, air under pressure is admitted at *F*, which presses the soles flat and embosses the treads. At the same time, the air is exhausted from the chamber in the table, the entrapped gases, fluids and moisture are forced out of the soles. Heat is then admitted to the vulcanizer through pipe *G*. [Clifford Lee, assignor to Goodyear's Metallic Rubber Shoe Co.—both of Naugatuck, Connecticut. United States patent No. 1,232,573.]

MACHINE FOR MAKING HOLLOW RUBBER ARTICLES.

In the accompanying illustrations a side view and sectional elevation are shown of one form of this invention, namely, a machine for making hollow rubber balls. It is supported on a base plate by two standards *A* and *B* and comprises two wheels *C* and *D* of similar diameter that are journaled in suitable bear-

ings and driven at uniform speed by a motor *E*. The upper wheel is offset from the vertical plane that passes through the axis of the lower wheel and in the periphery of each wheel are arranged the upper and lower mold halves with cutting and pressing edges that form the completed balls. The rims of the wheels are chambered for steam that is supplied through pipes *F*. Each cavity is provided with suction or vacuum openings connected by pipes to release valves *G* and vacuum valves *H*, supplied through pipes *I*, the flow of air to and from the molds being regulated by these valves which are automatically operated by cam rings *J*.

When the wheels are revolved in the direction indicated by the arrows, two strips of uncured stock *K* and *L* are fed to the upper and lower wheels, respectively, passing around guide rollers and under idler rollers *M* and *N*, causing the strips to adhere to the peripheral molds. The cam rings depress the suction valve stems and the strips of stock are drawn into the mold cavities when a pill of chemical material that will gasify under heat is automatically dropped into each of the lower molds. As the two wheels meet, the two strips of rubber are forced together at the edges of the cavities and the edges severed from the strip, when the action of the cam releases the vacuum and applies pressure in each cavity, the completed balls remaining in place until they are freed by their own weight. They are then placed in molds and vulcanized in the usual manner, when the gases produced by the action of heat on the chemical pills serves to expand the balls within the molds. [James W. Brundage, assignor to The Miller Rubber Co.—both of Akron, Ohio. United States patent No. 1,232,764.]

OTHER MACHINERY PATENTS.

THE UNITED STATES.

- 1,234,065. Vulcanizer for rubber tires. C. E. Miller, Anderson, Ind.
 1,234,431. Vulcanizing press. B. F. White, Rock Island, Ill.
 1,234,526. Machine for treating rubber and other heavy plastic material. F. H. Banbury, Ansonia, Conn., assignor to Birmingham Iron Foundry, Derby, Conn.
 1,235,117. Repair vulcanizer. Marion X. Corbin, Savannah, Ga.
 1,235,226. Machine for cutting disks of cork or similar material. A. Minnemann, Delmenhorst, Germany.
 1,235,757. Machine for treating rubber and other heavy plastic material. F. H. Banbury, Ansonia, assignor to Birmingham Iron Foundry, Derby—both of Conn.
 1,236,963. Tire skiver. B. E. Maxwell, Wichita, Kan.
 1,237,131. Method of manufacturing reinforced inner tubes and mandrels therefor. H. G. Welch, Philadelphia, Pa.

THE DOMINION OF CANADA.

- 176,340. Machine for building tires. The Miller Rubber Co., assignee of F. F. Brucker—both of Akron, Ohio, U. S. A.
 176,363. Repair vulcanizing core. W. L. Heenig, Marion Johnston and E. W. Ohls, assignees of a third interest—all of Denver, Colorado, U. S. A.

THE UNITED KINGDOM.

- 106,242. Vulcanizer. Soc. Pour La Production & La Vente Des Articles en Caoutchouc "Bogatyr" and J. A. Talalay, Bogatyr, Moscow, Russia.
 106,320. Machine for folding canvas strip for engine packing. G. Warwick, 80 Cobham Road, Seven Kings, Essex, and A. P. Crouch, 106 Cannon street, London.

PROCESS PATENTS.

THE UNITED STATES.

- 1,234,381. Plastic material and process of producing same. S. J. Peachey, Heaton Mersey, near Manchester, England.
 1,235,052. Manufacture of tires. R. B. Price, New York City, assignor to Rubber Regenerating Co., a corporation of Indiana.
 1,236,049. Process of making rubber-coated leather articles. J. H. Butler, assignor of one-half to F. W. Austin—both of Gloversville, N. Y.
 1,236,183. Coating composition and process of making the same. H. K. Kiso, New York City.
 1,236,235. Mollifier or comforter. A. R. Tufts, Vancouver, British Columbia, Canada.
 1,236,685. Process of manufacturing waterproof sheeting and the like. J. W. H. Dew, London, England.
 1,237,227. Cushion tire and method of making the same. J. L. Swartz, Akron, Ohio.

THE DOMINION OF CANADA.

- 176,205. Process of compounding rubber and fabric. The Standard Woven Fabric Co., Framingham, assignee of F. J. Gleason, Walpole—both in Massachusetts, U. S. A.

THE UNITED KINGDOM.

- 106,270. Plastic compositions. E. Krause, 6 Sedanstrasse, Steglitz, Berlin, and H. Blucher, 1 Kanalstrasse, Gohlis-Leipzig, Germany.

THE FRENCH REPUBLIC.

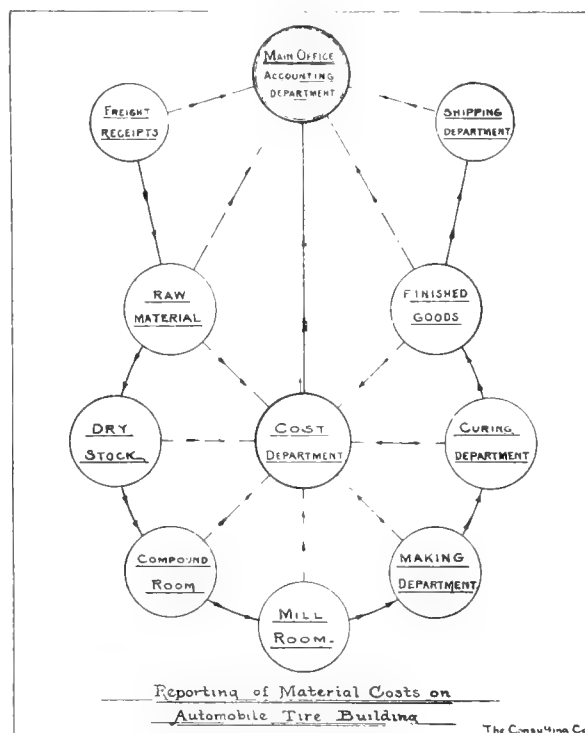

483,062 (September 30, 1916). Process for the manufacture of articles containing elements formed by a plastic and a fibrous material. The Rubber Regenerating Co.

483,064 (October 2, 1916). Armored plastic material. G. Couvert.

RAW MATERIAL COST ACCOUNTING IN TIRE FACTORIES.

The accounting of labor costs has in the past received considerable attention and study, with the result that labor cost figures are not difficult to compute. This is particularly true now that piece work prevails in so many factories. The progressive cost of raw materials, however, has not been given the consideration or thought that this important factor in manufacturing really deserves. For that reason the following diagram and explanation are of interest:

The smaller rubber factories rarely give enough credit to wastage in their cost accounting. Raw material, of whatever nature, in rubber manufacture, is undergoing a constant shrink-

age from the day the car is unloaded to the time the finished product is shipped. It is possible in time, from previous experience, to estimate a predetermined percentage for shrinkage as material passes through the various departments. But to check this predetermined shrinkage a system of reports should be made to the cost accounting department, and rigidly adhered to, thereby stopping many a leak before it reaches the proportion of a flood and finally becomes disastrous.

Referring to the diagram, the solid lines between the departments are represented by circles and indicate the travel, step by step, of the material through the various processes into the finished product. The dotted lines, between the departments and cost department represent a system of reports that are made to the cost department or main accounting department, as the case may be, covering what passed out of the particular department making the report, and to which department the material reported upon was delivered.

Thus the main office accounting department would have absolute control of factory costs through an accurate system of accounting that would show the cost of raw materials consumed in production, with full consideration of the shrinkage in process. [The Consulting Co., Cincinnati, Ohio.]

New Goods and Specialties.

APPLIANCE FOR MAXILLO-FACIAL MECHANOTHERAPY.

IN a recent number of "The Dental Cosmos" appears an interesting article by Emile Linet on a new appliance for maxillo-facial mechanotherapy, to overcome contractures of the mandible. The appliance, shown herewith, consists of two levers of the first class connected together at the fulcrum point. One end of each lever bears a small, strong tray, into which fits a piece of soft rubber to protect the teeth. The other end of each lever, *i. e.* the "force" end, bears two pairs of knobs which serve for the attachment of elastic rubber bands. Such bands, of known strength, are supplied with the appliance. The superior lever carries a scale, upon which a pointer upon the lower lever registers in millimeters the vertical distance between the two trays, *i. e.* the separation distance of the jaws.

The action of this instrument can be definitely measured and controlled and tends gradually to reduce and finally eradicate contractures, whether of cutaneous, articular or muscular origin. [The S. S. White Dental Manufacturing Co., Philadelphia, Pennsylvania.]

VULCANIZED RUBBER HAIR-PARTER.

A simple device which enables the user to be independent of a mirror and to part the hair easily and with exactitude consists of two flat strips of vulcanized rubber which may

be bent lengthwise to conform with the shape of the head. These strips are pivoted together, edge to edge, so that either strip may be swung around independently of the other. The strips are laid with their confronting edges along the line where the part is to be made. One strip holds the hair down on an imaginary line, while the other sweeps the free hair to one side, making a straight and even parting. [James Maxwell,

Senior, 108 West Forty-third street, New York City.]

SILUMINITE: A NEW INSULATOR.

This new insulating material is a hard black substance, ringing like slate, but of far greater strength; it can be sawn, filed, drilled, tapped, turned, and polished with ease, and can be molded to any shape in the course of manufacture, but not afterwards. It is not softened by heat (it is subject to a temperature of more than 600 degrees F. at the makers' works) and is not brittle. Immersion in oil or caustic alkali, or boiling water, leaves it unchanged, and it is non-hygroscopic. It possesses high dielectric strength, this being between 10,000 and 13,000 volts per millimeter. Its structure is homogeneous and dense, the weight of a square foot $\frac{1}{4}$ -inch thick being 2.4 pounds.

Metal parts can be insulated by compressing Siluminite on them in any desired shape, thus avoiding the cementing or screwing process now necessary in most cases. The substances with which it will most directly compete are porcelain, glass, mica, fiber, ebonite, wood, slate, marble and molded compounds. It is supplied in the form of rods, sheets, tubes and various molded specialties. [The Siluminite Insulator Co., Limited, Southall, London, England.]

THE "KANTSINK" SWIMMING HARNESS.

The beaches are thronged with bathers, the majority of whom cannot swim, yet are eager to learn, and a trustworthy aid that does not cumber the would-be swimmer's movements should find a ready market. In the apparatus shown in the accompanying illustration a rubber tube is fastened to the body with one buckle and traveling loops that permit perfect adjustment. The "Kantsink" swimming harness is made in two regular sizes, one for children up to 16 years and the other for men and women up to 40-inch bust measure. Extra large sizes are also furnished, if desired. [Kant Sink Swimming Harness Co., Traverse City, Michigan.]

RUBBERIZED SHARKS.

Sharks of such gentle disposition that feminine bathers may ride them over the waves are the latest seashore diversion, taking the place of the familiar surf-board. This ferocious appearing but harmless semblance of the man-eater that ter-

rorized the Atlantic coast last summer is made of rubberized fabric, inflated with air. It is light in weight and can be easily carried, yet it will support an adult and provides a means for the performance of many clever and thrilling water "stunts."

SANDAL GAITER WITH RUBBER SOLE.

A neat appearing sandal gaiter, shown herewith, is made with an all white rubber sole with white duck top, or red rubber sole and tip, or all black, and a top of tan duck or other storm-proof material. It is a combination of a sandal overshoe and

an over-gaiter, and protects the fine cloth tops of shoes, or silk hosiery when worn with low shoes, also acting as a new top for shoes that are partly worn and misshapen. This sandal gaiter is easily slipped on and fastened and, it is claimed, will fit any size ankle. As it can be folded and carried in a hand-bag or coat pocket it affords a convenient accessory to the traveling wardrobe. [The Styles Resurrection Co., Trenton, New Jersey.]

THE NELSEN DIVING LINE BUOY.

In drowning accidents would-be rescuers are frequently drawn under water by the victim, resulting in a double tragedy. Many times, also, bathers are drowned in the surf where a boat cannot reach them. The diving line buoy here shown is designed to meet all difficult situations in rescuing the drowning and to be carried as part of the regular equipment of boats, ships, yachts, etc., and at life saving stations, piers and docks. It consists of a strong, light-weight rubber tube, similar to a bicycle tire, with valves for inflation, and a life-line that may be 100 feet long. A tube at the end, of rubber or metal, has an inflating space, 1 by 1½ to 3 inches, inflated in the same way as a punching bag. This is 16 to 18 inches in diameter, and the smaller this tube, the farther it can be heaved. [Nelsen & Woods Manufacturing Co., 425 First National Bank Building, Long Beach, California.]

"FYBER-WELD" GOGGLES FOR WELDERS.

The protecting goggle is a very essential part of the welder's outfit, his safety frequently depending on the defense of his eyes from flying sparks. A goggle specially designed for this purpose is called the "Fyber-Weld." The frame is made of vulcanized fiber that is claimed to be an absolute non-conductor of heat and electricity, and the composition, although light in weight, is so strong that the goggle frame can even be thrown without breaking. Side pieces are of the ventilating type and the center is of soft, flexible leather. An adjustable elastic band allows the goggle to be comfortably and securely fastened to the head. The illustration shows the spectacle type of eye shield,

preferred by many, embodying the same principles and having rubber-covered cable temples. [Chicago Eye Shield Co., 2300-2304 Warren avenue, Chicago, Illinois.]

"CROGOFF," A NEW GAME.

A game combining the principles of croquet and golf utilizes a device resembling the numeral 6 in shape and having upright walls and a thickened base provided with rubber to prevent slipping. This is called a "coop" and in playing the game golf balls are driven into it by putters. The outfit consists of nine coops, two golf putters and two balls. The coops may be set up on a lawn, a room floor or the deck of a vessel, the rubber base holding them

securely to the surface, dispensing with the necessity of nails, screws or pegs. The formation of the coop allows the ball to enter and remain, thus taking the place of a hole socket. "Croff" is recommended as an ideal game for wounded soldiers. [The "Croff" Co., 123 Rotton Park road, Birmingham, England.]

RUBBER TUBE WATER FILTER.

The dangers of contaminated drinking water are well known, and soldiers, travelers, fishermen, hunters, etc., are apt to be placed in the uncomfortable position of going thirsty or running the risk of contagion. A device designed to remove this risk and render any water safe to drink consists of a slender tube of stout white rubber, with a red rubber cup at one end which is plugged with antiseptic cotton. The cup end of the tube is placed in the water, which is then drawn through the tube by suction. This automatic filterer is so small that it can conveniently be carried in the pocket. [The Ideal Rubber Co., Los Angeles, California.]

TRI-PLY COMBINATION ERASER.

Edge view showing inlay.

The special feature of this eraser consists of a combination of two grades of rubber, adapting it for use on all kinds of paper. In erasing typed matter on manifolds or other delicate sheets the ordinary eraser, suitable for use on a heavy, hard-surfaced paper, does not effect its purpose satisfactorily. Composed of a three-ply stock with a thin layer of harder grade rubber and two outside layers of soft, pliable rubber, this eraser has only to be turned at right angles to the paper when erasing on heavy sheets or at an angle of 45 degrees for the thinnest tissue in order to bring the proper part into play. The saving in time and annoyance to the user is self-evident, and the irregular hexagon shape is of further value in effecting difficult erasures. This handy office accessory is listed by the maker as No. 399. [Weldon Roberts Rubber Co., Newark, New Jersey.]

THE NATHAN COMFYKIT.

A durable and compact container for the many small articles in daily use by travelers, soldiers and sailors, is shown in the Nathan Comfykit. The case is made of two-ply rubberized auto cloth in olive-drab, neatly bound, and with many pockets for the various articles, which are 18 in number and range from a safety razor to safety pins. The kit, when opened, is 22½ by 9 inches and when folded, occupies space measuring 9 by 5 by 2¾ inches. Its weight complete is only 24 ounces. [Nathan Novelty Manufacturing Co., 84 Reade street, New York City.]

HEAVY ELASTIC AVIATION CORD.

The use of metal springs or other appliances in airplane construction, intended to resist the sudden shock of landing, has proven ineffectual for the purpose, and designers of modern airplanes have

tried various expedients with unsatisfactory results. It is due to the remarkable quality of india rubber that specially constructed heavy elastic cords are successful in heavy airplane construction to secure the cushioning effect when landing.

The wheel supports, at both front and rear of the machine, are provided with steel tubes that slide within each other. The rubber cords supply the necessary tension to the sliding supports, so that when the machine is on the ground the weight is cushioned by the tension of the rubber cords and when flying they are relaxed.

The standard cord is 9/16-inch in diameter, the core being composed of many square rubber threads laid parallel to each other and enclosed in a braided-on cover composed of hard-twisted yarn. Sixteen of these strands are generally used to a machine, but that depends, however, on the weight and style of the airplane. [J. W. Wood Elastic Web Co., Stoughton, Massachusetts.]

QUICK TIRE SERVICE, INC.

The Quick Tire Service, Inc., Louisville, Kentucky, has taken over the distribution of United States tires exclusively and has moved into new quarters at Third and Kentucky streets. The building is two stories high and contains 14,000 square feet of floor space. In every detail it is arranged to give prompt tire service to consumers, a special feature being its accessibility on all four sides. A. Craig Culbertson, formerly manager of the Compression Tube Co., succeeds C. T. Ballard, Jr., as manager, and Andrew Hunnicutt has been made assistant manager.

GERMANY EXTOLS RUBBER SUBSTITUTE GLOVES.

In a German publication (Silberstein and Colman, Zentralbl. f. Chir., 1916, No. 1) we read that the obvious disadvantages of rubber gloves—namely, their relatively high cost and poor wearing qualities—have led to search after efficient substitutes, one of which consists of a new preparation called "Sterilin," an organic ester which is applied to the hands in liquid form. Drying takes place in a few minutes, leaving a transparent, non-sticky coating impervious to bacteria and unattacked by benzin, oils, dilute acids, corrosive sublimate, blood, or pus, yet readily soluble in a preparation accompanying the outfit, or in acetone. It is said that antiseptic substances may be incorporated to increase the aseptic qualities of the preparation.

This sounds very fine, but we hazard the guess that the shortage of suitable rubber, not disadvantages of rubber gloves, led to the search for this substitute, and that with the coming of peace the merits of rubber gloves will again be appreciated in Teutonic countries. As a matter of fact, these so-called liquid gloves are not sufficiently durable to enable a surgeon to undertake long operations with them, and when left any length of time on the hands cause them to become numb and swollen.

RUBBER CASES BEFORE THE BRITISH PRIZE COURT.

An important rubber case lately came before Sir Samuel Evans, President of the British Prize Court. Messrs. Andresen & Muller laid claim to a quantity of rubber shipped on the Norwegian steamship "Bergensfjord," from New York to Bergen. The rubber had been seized as a prize on November 1, 1914, and the Crown claimed condemnation, contending that the goods, consisting of 347 cases of rubber, had been purchased from A. W. Brunn by A. Eber & Sohn, of Hamburg, Germany, through the account of Andresen & Muller as intermediaries. To support their claim, Andresen & Muller could produce a few cables, an invoice and one or two other documents. Counsel for the claimants declared that the documents proved that the purchase was made from their own monies and on their own account. It was, however, held that the documents were obscure and would have to be carefully collated before judgment could be rendered.

At a more recent sitting of the Prize Court, Sir Samuel Evans, the president, was requested by the Crown to condemn several packages of rubber seized on the three Danish steamers "Hellig Olav," "Oscar II" and "Frederick VIII." The rubber, done up in 11-pound packages to a total weight of six tons, had been sent from New York to Gothenberg, Sweden. Against this, Phillip Bauer & Co., Inc., New York City, protested on the ground that they were the owners. The Crown contended that the goods were destined for Germany and that, according to the evidence collected from intercepted cables and letters, the true claimants ought to be Phillip Bauer Co., of Hamburg, Germany.

The order of the Court was that the rubber be condemned as prize goods of absolute contraband nature destined for Hamburg.

An order for costs was made against the claimants, who were given leave to appeal.

TORPEDOED SHIPS NOW LOOTED OF RUBBER.

According to the crew of the torpedoed Norwegian steamship "Venglia," captured June 15 by a German submarine and used for 16 days unsuccessfully as a decoy for allied shipping, submarine crews whenever possible are looting captured ships of rubber and copper before sinking them. The U-boat commander stated that he had been away from his base for five months, supplies and torpedoes being brought by another U-boat whenever summoned by wireless. When his cargo hold was filled he would return home, he said.

The Editor's Book Table.

REPORTS OF THE PROGRESS OF APPLIED CHEMISTRY. ISSUED by The Society of Chemical Industry. Volume 1, 1916. London. Harrison & Sons. [8vo, 325 pages.]

THIS volume presents the progress of applied chemistry, from January, 1914, to June, 1916, reviewed in 15 sections, each by a recognized authority.

A section of 28 pages is devoted to India Rubber by H. P. Stevens, who gives a very comprehensive outline of progress under the following topics:

Statistics of Production; Production of Raw Rubber; Non-Caoutchouc Constituents of Rubber Latex; Effect of Details in Preparation; Properties of Rubber; Properties of Vulcanized Rubber; Physical Tests of Vulcanized Rubber; Quality and Uniformity of Rubber; Vulcanization; Accelerators; Synthetic Rubber; Analysis of Vulcanized Rubber.

The section concludes with over a hundred references to original sources and is a valuable compilation for the rubber chemist and student of rubber technology.

EIGHTEENTH YEAR BOOK AND ANNUAL REPORTS OF THE Rubber Association of America. Prepared by the Secretary. [8vo, 102 pages.]

This annual publication, prepared and printed for the members of the Association, contains a large amount of information of value to them, and also to all engaged in the rubber industry.

There is a full list of firm, associate and honorary members of the Association, the list of officers and standing committees. The several divisions are each represented in detail, with lists of officers, committees and membership. These divisions represent the manufacturers of mechanicals, soles and heels, sundries, hard rubber, also reclaimers, proofers, and those interested in foreign trade. The constitution and by-laws, the report of the seventeenth annual meeting, and the seventeenth annual banquet are given in detail. Included also are the rules and regulations governing transactions between buyers and sellers. There are excellent double page half-tones of the banquet and the outing of 1916.

While much of this has been previously published, its collection and arrangement in permanent form makes the book one valuable for reference in every rubber man's business office.

CHEMICAL PATENTS AND ALLIED PATENT PROBLEMS. BY Edward Thomas. John Byrne & Co., Washington, D. C. [8 vo, 58 pages, interleaved for notes. Bound in buckram. Price, \$2.50, delivered.]

This volume, for which a genuine need has existed, represents a complete rewriting of "Process Digest" by the same author, a member of the Appellate Federal Bars of New York and Washington, all the cases having been reread from the point of view of an attorney and expert witness, instead of that of a Patent Office examiner. Chemists and their attorneys will find it a clear and concise statement of the United States patent law. The major part of the work discusses broad underlying principles, while the remainder takes up points of practice and is accompanied by a virtually complete "finding list" of the cases on which the law of chemical patents is based, also including other important cases intimately related in reasoning. Upwards of 1,300 cases are cited under nearly 250 separate headings, with brief individual comments. All citations are given in footnotes, making the book interesting reading for the chemist and at the same time enabling the attorney to refer readily to pertinent cases. The references have been condensed by citing in general only the appeal case, or the last of a series, if that rules on all the points previously raised. Specific notes are given on the kind of evidence needed in chemical and allied cases, also notes covering cases on damages, licenses, etc.

THE FINANCIER RUBBER SHARE HANDBOOK. FOURTEENTH Edition, May, 1917. The Financier & Bullionist, Limited, London, England. [Cloth, 8vo, 877 pages. Price, 4 shillings, net.]

As in the past, this convenient handbook contains a wealth of details regarding the companies owning rubber plantations in Ceylon, South India, Borneo, Java, Burma, Sumatra, Africa, the Malay Peninsula and South America. It gives the authorized share capital of each of these companies, the amount issued, the balance sheet, the list of directors, acreage and similar information well arranged and quickly available. An alphabetical list of directors in all these companies is appended, including a list of secretarial groups with London addresses. In his preface, E. L. Killick, rubber expert of the "The Financier," explodes the boggy of over-production, showing that enormous expansion of the world's consumption has kept pace with increased production. He further points out that as there has been no extensive planting in the Middle East since the period 1910-12, and as the rate of increased production will rapidly decline beginning with 1917, a continued increasing demand at the past rate will find the world facing not a surplus, but an actual shortage of rubber.

BRAZIL TO-DAY AND TO-MORROW. BY L. E. ELLIOTT, F.R.G.S. The Macmillan Co., New York City. [8vo, 338 pages, illustrated, cloth. Price, \$2.25.]

Brazil continues to be a land of much moment to the rubber trade, which will welcome this handsome, absorbing and comprehensive work by one who knows the country well. Its history and colonization are interestingly narrated and the present and probable future status of its social conditions, transportation, industries, finance and commerce are clearly set forth. The chapter on the world's horticultural and medicinal debt to Brazil is little short of a revelation.

A section of 28 pages presents intelligently the history, development and details of the rubber industry of the Amazon as contrasted with the plantation industry of Malaysia. Methods of latex collection and coagulation, the system of labor and financing, and the various kinds and grades of Brazilian rubber are described. Measures necessary to put the industry on a sounder basis, particularly more careful, cleanly and uniform methods of coagulation, and more equitable and stable export taxes, are outlined. The controversy is also referred to as to the relative merits of plantations or further opening up of the untapped reserves of the interior, estimated at 300 million trees, many of them "black" *Hevea* yielding especially high quality latex. The author doubts if the present average rubber production of about 37,000 tons is likely to increase greatly for a time at least, because of the scarcity of labor, the high cost of living and the enormous expenditures necessary on roads, drainage and the like to open up virgin forests.

THE MANUFACTURE OF RUBBER GOODS. BY ADOLF HEIL and Dr. W. Esch, translated by Edward W. Lewis, A.C.G.I., F.C.S. Charles Griffin & Co., Limited, London, England. J. B. Lippincott Co., Philadelphia, Pennsylvania. [Large 8vo, 236 pages, illustrated, cloth. Price, \$4.]

Among the authoritative technological handbooks for the use of manufacturers, chemists and others engaged in the production of rubber goods this work has since 1909 occupied a prominent place. While the present reprint assumes a more elementary character at this advanced stage of the industry, it sets forth clearly and concisely those sound fundamentals which must still be the basis of successful manufacture, and will prove a useful addition to the library of every rubber man of the younger generation. Five chapters are devoted to the raw material, the vulcanization of rubber, the mixings, the manufacture of soft rubber articles, and the manufacture of ebonite. The

introduction details a plan and arrangement of a rubber goods factory, and two appendices are devoted to reclaiming rubber and specific gravity.

COMMUNICATIONS OF THE NETHERLANDS GOVERNMENT IN-
TENDING TO ADVISING THE RUBBER TRADE AND THE RUBBER INDUSTRY
IN THE DUTCH EAST INDIES. Part I. [Paper cover, 72 pages.]

In our issue of April, 1917, we reviewed a collection of important papers recording researches made in the above institute and published by the Trade Department of the Netherlands Ministry of Agriculture, Industry and Commerce, under the title, "Mededeelingen van den Ryksvoorlichtingsdienst ten behoeve van den rubberhandel en de rubbernijverheid te Delft." These papers were preceded by an introduction showing the relation between the various subjects treated. The International Association for Rubber Cultivation in the Netherlands Indies, recognizing that the fact that these valuable studies were written in Dutch would prevent their wider perusal, now offers an elaboration in English of this introduction. This first of the six parts in which the English version is to appear, is now ready for the public. It treats "The Examination of Latex and the Valuation of Raw Rubber According to the Exterior," seven sub-divisions being as follows:

- I. The state of colloidal aggregation of the rubber in the latex.
- II. Determination of the caoutchouc percentage of latex.
- III. The non-caoutchouc compounds of the latex.
- IV. The different methods of preparing rubber.
- V. External valuation of raw rubber.
- VI. Spots on raw rubber.
- VII. Transparent raw rubber.

While the introduction mentioned facts not elsewhere published, this elaboration contains points not found in the separate papers of the complete Dutch work. On the other hand, the subjects are, of course, hardly more than rather detailed summaries.

JAARBOEK VAN NEDERLANDSCH INDIE, 1916. AFDEELING
Nijverheid en Handel van het Departement van Landbouw, Nijverheid
en Handel, Buitenzorg, Java. [Limp cloth, 237 pages, 31 illustrations,
tables.]

This finely illustrated yearbook of the Dutch East Indies was compiled by the Section for Industries and Commerce of the Department of Agriculture, by order of the Dutch East Indian Government, and presents a general review of the conditions in these colonies as they were in the year 1914. The opening chapter is devoted to a short description of the geological nature, climate, population, flora and fauna of the islands. Further brief and lucid chapters treat such subjects as Government and Judicature, Finance and Taxation, Agriculture, Commerce, Traffic and Communications. In connection with the rubber industry, the number of enterprises, their distribution, the acreages devoted to the different kinds of rubber, as well as the quantities and values exported during several years, find mention. Most of the subjects are prefixed by a short historical summary.

Although occasionally more detailed treatment would have been desirable, the volume is both interesting and valuable, and since it is published in English, should find a large circle of readers.

WIRES AND CABLES. BULLETINS 49302-3-4. GENERAL ELECTRIC
Co., Schenectady, New York. [4to, 84 pages.]

These bulletins, of a series distributed by the above-named company, while in the nature of a catalog, contain a great amount of information as to the progress and method of underground and submarine transmission of electricity. Description of the various forms of cables, terminology decided upon by the Bureau of Standards, tables giving resistance, inductance, reactance, impedance, maximum voltages of cables, cords and flexibles are given, and added to this are descriptions of coupling boxes, cable bells, junction boxes, manhole boxes,

tapes and splicing gum and filling compounds. In all, the bulletins are informative and attractive.

NEW TRADE PUBLICATIONS.

THE Federal Rubber Co., Cudahy, Wisconsin, has published a little booklet entitled "Care Saves Wear," which treats of the care of tires. Photographs of damaged tires are shown and full explanations given of the causes of injury, with suggestions for prevention. Motorists can read this book with interest and profit.

* * *

Users of trucks—and what progressive manufacturing firms to-day are not?—will find interesting and informative reading in two well-illustrated booklets now being mailed on request by the Link-Belt Co., Chicago, Illinois. They are entitled "Link-Belt Roller Chains for Tractors and Trucks" and "Some Facts About Roller Chain Drives." The latter is written by a large user of chain drives, the Smith Motor Truck Corporation, Chicago, Illinois, and points out particularly the growing list of government decisions in favor of chain drive which has resulted from the severe tests of European warfare. Every argument appeals to reason.

* * *

With the determination of the United States Government to do its share in winning the war very largely through the air, the Army and Navy Air Services have come into far greater prominence than hitherto and seemed to demand a specialized publication devoted to their interests. The Gardner, Moffatt Co., New York City, was quick to meet this need with the "Air Service Journal," a new illustrated weekly which made its first appearance July 12 with the announced purpose to chronicle the news of the entire aircraft industry; to relate foreign events in the air; and to record progress and tell of personnel. Judging by the character of the first issue, with its special authoritative articles on military and naval aeronautics, the paper will prove of value to manufacturers, officers, enlisted men and all engaged in the aircraft industry or service. The subscription price is \$3 a year; foreign subscription, \$4.

* * *

"The Journal of the Society of Automotive Engineers," formerly the "S. A. E. Bulletin," made its appearance dated July, 1917, as a handsome 9 by 12 inch standard size technical paper of 96 pages, with 78 additional pages of advertising. Henceforth its attractive appearance, varied contents and authoritative character bespeak for it a prominent place among American engineering journals. The first issue is devoted chiefly to the papers and reports read at the semi-annual meeting of the S. A. E. held June 26 at the Bureau of Standards, Washington, D. C., and indicate the vast amount of constructive assistance being rendered the government in perfecting and standardizing automotive construction of every type for war purposes. Many illustrations, diagrams and portraits embellish the text. The publication is issued monthly from the offices of the society, 29 West Thirty-ninth street, New York City, subscription price, \$5 a year; to members, \$2.50 a year.

* * *

No one who has read H. S. Firestone's article, "Three Important Lessons My Business Has Taught Me," in "System" for July, will marvel at the success of the Firestone Tire & Rubber Co., with its assets of over \$33,000,000, surplus of \$18,000,000 and 1917 business estimated at \$60,000,000. Such principles of integrity, sound judgment and determination are bound to win. While pointing out fundamentals, Mr. Firestone claims to know of no absolute formula for success. "Simmered down," he writes, "business success depends chiefly upon the man and his adaptability and willingness in balancing his own factors of strength and weakness, and appraising and balancing the corresponding factors in others."

Interesting Letters from Our Readers.

MALAYAN PLANTERS FEAR AMERICAN COMPETITION.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—The restrictions upon the export of rubber from the Malay Peninsula chiefly through the rigid control of the Tin & Rubber Committee of London, still is a subject of much interest and concern to American buyers and importers as well as to the Malayan planter and shareholder. It would appear that the latter, however, are impressed that their territory and the plantations they control are necessary to the world's supply of rubber and, therefore, are to an essential degree monopolistic.

The results of this erroneous view are being suspicioned and will soon, no doubt, be realized by these planters and shareholders as they see their present profitable (45 cents a pound net) American customer forced to abandon them.

The planters and shareholders of Malaya have great fears of Americans forcing down the prices—the abnormal prices—they have enjoyed from the world and especially from America, of fully 45 cents a pound net profit. I quote from a recent interview of the well known firm of Baker, Morgan & Co., Limited, in the "Straits Times," of Singapore:

Our greatest fear would seem to be American buyers forcing down the price out here (Malaya) greater than the fear of overproduction. With regard to this we fancy the government may be relied upon to step in . . . and fix a minimum price per pound . . .

This expressed opinion is but one that is prevalent there showing the local erroneous view that Malaya has the only rubber favored portion of the earth, and because of the monopoly their government can by law—by a printed statute—fix the minimum price which the outside world will have to pay, if they want the product. The ancient established principle of "supply and demand" as governing prices appears to have been entirely lost sight of as an equilibrium and safety valve. It is this erroneous, if not fallacious conception of things as they exist that the planters and shareholders are deceiving themselves thereby.

The restrictions by law recently enacted in amendments to the "Land Rules, 1904, Section 13," governing the alienation of lands in the F. M. S. Malay Peninsula, limit the title to not more than 50 acres to any except to British subjects. This has successfully barred out any planting by Americans. I quote from an editorial in the "Malayan Rubber Journal," entitled, "The American Invasion":

. . . and we are inclined to think that the F. M. S. Government's present policy of refusing to give any one except a British subject more than 50 acres of state land is intended primarily to delay an "American Invasion" until such time as a decisive policy is agreed upon.

The planters there are apparently disturbed by a bogey and are imagining ghosts and hobgoblins along the line as to the so-called "American Invasion," as is evidenced further from editorials from the same journal, which express in part the prevailing sentiment there:

. . . we dislike their (Americans) way of seeking to turn everything into a monopoly or trust, and for this latter reason have opposed their entry into Malay as rubber planters, . . .

The Standing Committee of the Planters Association of Malay at its recent meeting reported under the head of "Rubber's Chief Menace" amongst other things, as to the alienation of land:

The matter was discussed . . . and resulted in a request to the Federal Government to stop the alienation of land to aliens at a time when neither British capital nor British superintendence was available for opening up land.

The same report also states that the Rubber Growers' Association of London simultaneously approached the Secretary of

State for the colonies and as a consequence the High Commissioner has notified that no land exceeding 50 acres in the Federated Malay States will be alienated to any one except a British subject.

The Creator of the earth did not make Malaya and Ceylon the only spots on the globe suitable for the growth and production of *Hevea* rubber. The soil and climate of some of the islands of our own Philippines are equally as suitable by nature. I instance Basilan island of the department of Mindanao and Sulu. Also Sumatra, the third largest island on the globe, whose rubber producing domains have scarcely been explored or penetrated. Java is producing by leaps and bounds. W. H. Rickinson, the world-renowned rubber statistician and authority, states the exports from Java the first three months of 1916, were 2,531 tons; for the same period of 1917 they were 5,042 tons—approximately double or, to be exact, an increase of 99.1-10 per cent.

The Secretary of the Rubber Growers' Association of the Netherlands East Indies told me while I was in Batavia the fore part of the year, that the ratio of natural increase in the Dutch Indies based upon acreage planted and tree-age, would yield 120,000 tons or thereabouts in the year 1919. That is about the estimated requirement for America this year.

JESSE E. LA DOW.

Secretary of the Mansfield Tire & Rubber Co.

Mansfield, Ohio, August 8, 1917.

EXTRA DURABILITY IN TIRE TREADS.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—Believing some results obtained with a special composition of rubber, invented by me, are sufficiently novel and show points of advantage over regular mixings such that the material is worthy of note in THE INDIA RUBBER WORLD, I am mailing you data in reference to the material as used in treads of pneumatic tires.

First comparative results showed the specific gravity of factory regular white tread stock 1.80—of Textile, white tread stock 1.12. Comparison of weights of complete tires in size 32 by 3½—factory tire with regular stock throughout 14 pounds, 10 ounces, same but with Textile composition in tread only, 12 pounds, 6 ounces. Placed on rims and both inflated with same pressure, Textile tread measured ⅝ inch less in circumference from edge of rim to edge of rim than the regular tire.

This inflated measurement test brings out some points in tire construction that cannot be ignored. In the regular tire, it shows the carcass is stretched (weakened), the tread is also stretched and as stretched rubber is much easier to surface cut and puncture, the tire is weakened in every particular by the stretch. In comparison, the Textile tread, by resistance to stretch, not only retains, but adds to, the full strength of the carcass. Also this tread is not stretched and so retains all of the superior wear and resistance to cuts and punctures that are marked characteristics of Textile rubber.

To show the resiliency of Textile rubber a test that was made with a view to its use in solid truck tires is given. A section 4 by 3 by 1½ inches was placed under hydraulic pressure; the 3-inch measurement was compressed to ¼ inch by an amount of pressure registering 90 tons. When released, the section returned to all original measurements without a break.

The tires in actual service on cars are showing that the nap of the incorporated textile at the surface affords superior traction and resistance to slipping on wet pavements. The wearing service is proving more than equal to expectations, but as they

have been run only a few thousand miles at this writing, a total mileage report cannot be given now.

The extreme lightness in gravity of Textile rubber suggests its value in making pneumatic tires for airplanes.

JOSEPH R. SANFORD.

Salisbury, Connecticut, August 18, 1917.

THE OBITUARY RECORD.

ORGANIZER, BUILDER AND CONTRACTOR.

HARRY L. LEWMAN, president of the Ten Broeck Tyre Co., Louisville, Kentucky, died in that city in July after a prolonged illness, aged 51 years and one day. Mr. Lewman was born in Gosport, Indiana, July 15, 1866, though a large part of his business life was spent in Louisville. For many years he was in the general contracting business in association with his father, M. T. Lewman. The firm was noted for handling large contracts, prominent among which was the erection of the government dam in Warrior River, Alabama. This company made a specialty of courthouses and is said to have built more courthouses in the South than any other concern in the country.

In 1913 Mr. Lewman founded and organized the Ten Broeck Tyre Co., becoming its president and having personal supervision of the erection of the plant and the building up of the business, which he had the pleasure of seeing develop to such an extent that it was deemed necessary to greatly enlarge the original plant, and to add a textile mill for the purpose of weaving its own tire fabric, and this undertaking was nearly completed at the time of his death.

Mr. Lewman was twice elected president of the National Association of Master Builders. He was a member of Masonic orders. He was also a large property owner in Louisville and possessed holdings in several local enterprises. He is survived by a widow, a daughter and three brothers.

A PIONEER TIRE EXPERT.

W. Scott Alkire, prominent in the tire department of The B. F. Goodrich Co., Akron, Ohio, died at his home in that city recently, aged 54 years.

Mr. Alkire was one of the few men who grew up with the company. He entered its employ 26 years ago, and has seen it grow from small beginnings to its present prodigious proportions, and in its progress he was a factor. When the pneumatic bicycle tire business became important, he entered the tire department, and with the rise and growth of the automobile tire industry, he steadily progressed, becoming assistant superintendent of that department, relinquishing that office to become a prominent member in the experimental department, where his practical knowledge proved of great value to the company.

BORE A WELL KNOWN NAME.

Hon. Morton E. Converse, founder of Toy Town (Winchendon, Massachusetts,) died August 25, at the age of eighty. He was of the Converse family, notable as the founders of the Boston Rubber Shoe Co. He was a Civil War veteran, a member of the Massachusetts House of Representatives and Senate and a member of many clubs and orders, and was noted for his public spirit and broad philanthropy.

SON OF A PROMINENT RUBBER MANUFACTURER.

H. Norman Grieb, son of William G. Grieb, president of the Ajax Rubber Co., Inc., New York City, died in Paris, France, August 26, of pneumonia, following injuries received while flying. He went abroad in May, with the Yale medical unit, but on his arrival in France joined the French aviation

service. He had received his pilot's license and had been detailed to active duty at the front at the time of the accident. He was 22 years old. A brother, Harold, 20 years old, is also in France.

BRITAIN PERMITS IMPORTS OF RUBBER GOODS.

Since May 10, 1917, the importation of rubber manufactures into the United Kingdom has been prohibited. According to a recent cable from London it is understood that Great Britain is now prepared to license rubber imports to the extent of 15 per cent of the amounts imported in 1916. Application should be made to the Department of Import Restrictions, London.

United Kingdom imports for the calendar year 1916 were as follows: Waterproofed apparel, £9,518; boots and shoes, 250,746 dozen pairs, £438,196; insulated wire, £133,728; submarine cables, £7; automobile tires and tubes, £2,207,210; motorcycle tires and tubes, £93,173; cycle tires and tubes, £113,442; tires not specified, £10,040.

TENNIS SHOE PRICES.

The tennis shoe season ends early in September, and it has been the custom of the manufacturers of these goods to announce prices for the next season on September 1. This year, however, the United States Rubber Co. sent out new price-lists on August 1, and the other manufacturers were but a few days behind with their announcements.

With the enormous advance in costs of materials and labor, it was natural to expect a heavy advance over previous prices, and under the circumstances it was somewhat of a surprise that the advance was so moderate. In some of the finer lines, those wholesaling between \$1 and \$2.50 a pair, 10 to 25 cents was added, but on those selling at less than \$1 last September, 10 to 15 cents was the maximum advance.

It may be remembered that last year another list was sent out late in October which showed material advances over September, 1916, prices. The present price-list in some cases shows no advance over the October one, while in few cases are the prices more than 15 cents higher, and most of these cases are in lines which were not advanced in the October list.

Whether these August, 1917, prices, which are "subject to change without notice" will be supplanted by later announcements this fall, is impossible to foretell. Costs of materials are constantly increasing. Taxes are heavier. There are possibilities of further labor demands. If the manufacturers readjust prices later, as they did last October, there is no doubt that many, or all lines of tennis shoes will be marked up from August 1 prices.

ASBESTOS MINE DISCOVERED.

An asbestos mine has been discovered at Horsehide Springs, Rattlesnake Mountain, Wyoming, which promises commercial value, even though the mineral will have to be conveyed 150 miles, probably by motor trucks, to the nearest railroad. The find is reported by C. B. Stewart, secretary of the Utah Wool Growers' Association, whose automobile broke down at the location, thus leading to the discovery.

NEW LINE TO CALLAO.

W. R. Grace & Co., New York City, will establish a line of fast steamers between that city and Callao, Peru, by means of the Panama Canal, making the trip in 11 days. At present the best service between New York and Callao requires about 20 days, making allowance for a delay of from 4 to 6 days on the Canal Zone. The firm has a well organized branch in every port along the Pacific coast of South America, and will be able to supervise closely the work of discharging its own vessels.

News of the American Rubber Trade.

McGraw Annual Sales Conference.

THE McGraw Tire & Rubber Co. held its annual sales conference on August 2 and 3, all branch and district managers gathering at the home office, East Palestine, Ohio. Sales policies were carefully discussed and it was decided to continue the successful method of selling exclusively through jobbing channels. Increased warehouse facilities are being arranged for at important distributing centers to care for the growing demand for McGraw, Pullman, Imperial and Congress tires and tubes.

The executive changes in the company's personnel are as follows: R. E. Hayslett, formerly connected with the Timken Roller Bearing Co., has been made assistant to John Morgan, vice-president and treasurer. R. G. Nelson, formerly assistant sales manager, is appointed director of sales, assuming direct control over all general office and branch sales. F. C. Strayer has become Atlanta district manager.

RUBBER COMPANY DIVIDENDS.

The Hood Rubber Co. paid a quarterly dividend of $1\frac{3}{4}$ per cent on August 1 to stockholders of record July 26; also a 1 per cent dividend on August 15.

The Amazon Rubber Co. has declared a dividend of $3\frac{1}{2}$ per cent on preferred stock, payable September 1 to stockholders of record August 20.

The Ajax Rubber Co., Inc., has declared a regular quarterly dividend of \$1.50 per share, payable September 15 to stockholders of record August 31.

The B. F. Goodrich Co. has declared a dividend of $1\frac{3}{4}$ per cent on preferred stock, payable October 1 to stockholders of record September 21; also 1 per cent on common stock, payable November 15 to stockholders of record November 5.

The board of directors of the Pennsylvania Rubber Co. has declared a regular quarterly dividend of $1\frac{3}{4}$ per cent on preferred and $1\frac{1}{2}$ per cent on common stock, payable September 29 to stockholders of record September 15.

RUBBER COMPANY SHARE QUOTATIONS.

The following market quotations of shares of rubber manufacturing companies on August 25 are furnished by John Burnham & Co., 115 Broadway, New York City, and 41 South La Salle street, Chicago, Illinois.

	Bid.	Asked.

PETLEY RUBBER COMPANY ABOUT TO OPERATE.

The Petley Rubber Manufacturing Co., notice of whose incorporation appears elsewhere in this issue, has purchased outright the entire machinery and equipment, together with all material, dies, molds, etc., of the Oldtown Rubber Co., of Xenia, Ohio, and these are being moved to Milwaukee, Wisconsin, where the Petley company will occupy the premises at 241-247

Oregon street. New machinery is being added to that purchased from the Oldtown company and operation at the Milwaukee plant will commence early in September.

L. M. Bickett, former superintendent of the Oldtown Rubber Co., together with D. A. Bickett, of the same company, have joined the Petley forces at Milwaukee.

THE MASON TIRE & RUBBER APPOINTMENTS.

John H. Diehl has been appointed general sales manager of The Mason Tire & Rubber Co., Kent, Ohio. Starting with The B. F. Goodrich Co. in 1894, he later served successively as manager of the Philadelphia and the Buffalo branches of that company. He joined the Portage Rubber Co., Akron, Ohio, at the time of its organization in 1912, as salesmanager, and has been with that organization in the position of manager of sales for the last five years.

JOHN H. DIEHL.

George C. VanVeen has been appointed manager of the new direct factory branch of the Mason Tire & Rubber Co., which has recently been opened at 2120 Michigan boulevard, Chicago, Illinois. He will also have charge of sales of Mason tires for the entire central district of the United States. He has been manager of the Kansas City branch since it was opened and his work there was so successful that he has been given the promotion to Chicago.

Mr. VanVeen started his business career in the automobile industry in New York City, but soon entered the tire field with the Ajax-Grieb Rubber Co., New York City, being located in the Middle West. He left this concern to enter the retail tire business in Detroit, Michigan, later selling out to become associated with the Mason company, whose business has shown splendid growth in the territory of which Mr. VanVeen has had charge, and the steadily increasing business is largely due to his energy and knowledge of the business.

G. C. VANVEEN.

H. C. Smith has recently been appointed manager of the Kansas City branch of the Mason Tire & Rubber Co., succeeding Mr. VanVeen. Mr. Smith has been a salesman with the Kansas City branch since it was established, and his advancement to the position of branch manager is due to his very successful record. He has had many years of successful experience in the rubber business. For five years he was with The B. F. Goodrich Co., Akron, Ohio, and knows the trade in the West and Southwest thoroughly, particularly in the states of Missouri, Kansas, Nebraska, Oklahoma, Texas, New Mexico, Colorado and Wyoming, and this acquaintance, together with his experience in the Kansas City branch, makes the appointment specially appropriate.

H. C. SMITH.

MAJOR OSTERRIETH AND HIS CANINE PAL.

WHEREVER the Belgian Commission has been entertained with acclaim in America, the commanding figure of Major Leon Osterrieth, former rubber merchant of Antwerp, has arrested the attention of every onlooker. Of towering stature, huge physique, distinguished bearing, and in facial characteristics somewhat resembling the late King Edward VII of

TWO BELGIAN VISITORS TO AMERICA.

England, he stood head and shoulders above all the other members of the Commission and was the first to be seen in a crowd. Few except those near him, however, noticed the wire-haired fox terrier that was seldom absent from his side, yet Major Osterrieth declined to accompany the mission to America when refused permission to take "Nellie" with him. The Belgian Government gave in, however, the dog is on the trip and so comes to light a touching little human interest story of canine devotion and a master's appreciation.

"Nellie" first went to Belgium with an English army officer during the early days of the war. The Englishman was killed, and for weeks "Nellie" wandered aimlessly among the Belgian and English. Time after time officers and soldiers sought to make her a pet but in vain. "Nellie" was what dog fanciers call a "one man dog" until she ambled by the major's tent one day and heard his deep voice proffer a kindly invitation to share his meal. For the first time since the death of her old master "Nellie" displayed friendliness and accepted the bone he offered her. Then she disappeared.

During the German attack that night the major forgot "Nellie." Not until the early hours of the morning was the attack repulsed. Then as the major was settling down to sleep in his make-shift cot he heard a piteous whine outside the tent. He got up and looked out.

There was "Nellie." A German bullet had almost torn her right shoulder off. The big scar can be seen there today. Tenderly did the major take the dog in. He bound up the wound and gave "Nellie" a place in his quarters. Since then the dog has never left him, and his affection for his canine pal in some of the bitterest battles in the war can only be measured by his willingness to sacrifice a great honor to prevent their separation.

DOMINION RUBBER SYSTEM PROMOTIONS.

H. R. Willans, druggists' sundries department, Montreal branch, has been transferred to the Ottawa branch as salesman for druggists' sundries and waterproof clothing.

Alfred E. Cox succeeds Mr. Willans at Montreal.

L. A. Blanchard has joined the staff of the Montreal branch and will develop trade for Rinex soles and heels among shoe manufacturers.

PERSONAL MENTION.

Among the names on the Birthday Honors List of the King of England was that of Sir Frederick Smith, Bart., J. P., who has been created a Baron of the United Kingdom. Sir Frederick is chairman of Chas. Macintosh & Co., Limited, which firm he joined about 25 years ago. He is also chairman of the New Liverpool Rubber Co., Limited, the North Borneo Rubber Co., Limited, and is on the boards of the Lancashire and Yorkshire Bank and of the Garswood Hall Colliery Co. In the year 1912 he was created a baronet.

Thomas A. Aspell, who has been manager of the truck tire department at the New York City branch of The B. F. Goodrich Co., Akron, Ohio, has been placed in charge of the specification work this company is doing for the United States Government. While this duty will require his frequent presence in Washington, D. C., he proposes to make his headquarters in Akron.

J. E. Powers, who for the last eight years has been in charge of the truck tire department of the Buffalo (New York) branch of the B. F. Goodrich Co., Akron, Ohio, has been appointed to a similar position at the New York City branch of the same company.

Victor Van Der Linde, recently returned from a tour through Norway, Sweden, Finland and Russia doing special technical work for The B. F. Goodrich Co., Akron, Ohio, has great confidence that the Russian democracy will do its full share in the struggle against German autocracy. Mr. Van Der Linde was in Petrograd when the revolution took place, and had an exceptional opportunity to observe its immediate causes and effects. The American commission, headed by Elihu Root, he says, put new confidence into the Russian people. The army is now eagerly resuming the offensive and if an adequate supply of munitions, food and clothing be maintained by the workmen, will fight as never before. Europe generally, he says, is much impressed by the entry of the United States into the war, yet it is his personal opinion that the war cannot end under two years' time.

Albert F. Hill has severed his connections with the Rubber & Guayule Agency, Inc., and on and after October 1 will be connected with the firm of Wallace L. Gough & Co., 15 William street, New York City.

Fred Haupt, formerly vice-president of the Ten Broeck Tyre Co., Louisville, Kentucky, has succeeded to the presidency, filling the vacancy created by the death of H. L. Lewman.

Arthur H. Clark, formerly of the Lyscoming Rubber Co., Williamsport, Pennsylvania, has been made assistant superintendent of the St. Louis, Missouri, plant of the Goodyear's Metallic Rubber Shoe Co.

C. W. Hardin has been appointed manager of mechanical sales of the Republic Rubber Co., Youngstown, Ohio.

R. L. Devoe, for several years branch manager at Chicago, Illinois, of the Dayton Rubber Manufacturing Co., and more recently assistant sales manager at the home plant at Dayton, Ohio, has been made sales manager. It is claimed that the 1918 expansion plans will place this company among the more prominent rubber manufacturing plants of the country.

A. Boyd Cornell, secretary of the Empire Rubber & Tire Co., Trenton, New Jersey, has tendered his resignation. He started in the rubber business immediately after graduating from Princeton in 1901, and worked in every department, thereby gaining practical knowledge of the business. Several propositions are being considered, but his future plans are not yet decided upon.

Harry R. Nason has been chosen secretary of the Empire Rubber & Tire Co., Trenton, New Jersey, succeeding A. Boyd Cornell, resigned.

John F. Bresnahan has been appointed general sales and advertising manager of the American Chicle Co., New York City.

NEW OFFICERS FOR WESTINGHOUSE.

The board of directors of the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, recently elected officers for the ensuing year as follows:

Guy E. Tripp, chairman of board; E. M. Herr, president; L. A. Osborne, Charles A. Terry, H. P. Davis, H. D. Shute, H. T. Herr, Walter Cary, vice-presidents; T. P. Gaylord, acting vice-president; James C. Bennett, comptroller and secretary; Warren H. Jones, assistant secretary; H. F. Baetz, treasurer and assistant secretary; S. H. Anderson, assistant treasurer and assistant secretary; L. W. Lyons, assistant treasurer; F. E. Craig, auditor; W. B. Covil, Jr., and Wm. J. Patterson, assistant auditors.

In addition to its regular dividends, on July 31 the Westinghouse company paid a special Red Cross dividend of 25 cents per share on all capital stock outstanding, both preferred and common.

STUNGO-RADIUM RUBBER CO. WILL OPERATE SOON.

As a result of action taken by a dissatisfied stockholder the affairs of the Stungo-Radium Rubber Co., Washington, Pennsylvania, were placed in the hands of a temporary receiver on July 20. After a four days' hearing, beginning July 24, before Judge Irwin, of Washington County, however, the receivership was dismissed, it having been shown that the affairs of the company are in excellent condition, but that the inability of one stockholder absolutely to dominate the policy of the company had been the cause of some internal dissension which had been nearly eliminated.

The company has available assets in plant, cash and accounts receivable exceeding \$500,000, and liabilities of less than \$75,000, of which \$50,000 is a mortgage on which no payments are required until 1920. A large portion of the machinery is already in the plant, the first unit of which will be in operation about November 1, with a capacity of 500 tires daily. Equipment for a second unit of the same size is already being manufactured, as the company now has sufficient orders for operation at full capacity for more than a year.

The officers of the company are: Floyd Rose, president; R. P. McDonald, secretary and treasurer; Floyd Rose, Bert S. Shafer, John W. Rinehart, R. P. McDonald and Joseph Stungo, directors. The first three directors named comprise the executive committee now in control of the company's affairs.

MADERO SUED FOR PATENT INFRINGEMENT.

A suit has been filed in the Federal Court, San Antonio, Texas, against Salvador Madero and others, by Ferdinand Ephraim, of San Francisco, California, for damages due because of infringement of Mexican Patent No. 4,079, granted Ephraim October 29, 1904, for a process of extracting gum or rubber from any rubber-bearing plant or shrub. This suit was filed in Texas because the courts of Mexico are closed, and Madero is a resident of San Antonio. The plaintiff claims that for a number of years past Compania Explotadora Coahuilenese, Compania de Hule Australia and Compania de Las Delicias have been and now are corporations foreign to the United States of America, namely, corporations organized and existing under and by virtue of the laws of Mexico; that Salvador Madero, Francisco Del Hoyo and Antonio Villalbo, Sr., are associated as copartners under the name of Salvador Madero & Co., and that Salvador Madero is the general manager or agent of these corporations. The claim is made that these firms have, without consent of the patentee, used this patent in the production of upwards of 30,000,000 pounds of rubber from the guayule shrub, and have received from the sales of this rubber, principally in the United States, a sum exceeding \$8,000,000. Plaintiff asks judgment for that amount, besides costs of suit, counsel fees, etc.

The result of this suit will be awaited with interest by the rubber trade of this country and Europe.

PENNSYLVANIA RUBBER CO. INSURES EMPLOYEES.

The Pennsylvania Rubber Co., Jeannette, Pennsylvania, has arranged for the life insurance of its men and women employes, on a graduated scale, depending on the length of employment. The payments of the premiums are made by the company. Those who have been employed one full year or less, are insured for \$300; two full years or over, \$500; and for each full year over two, an increase of \$100 annually until the maximum of \$1,000 is reached, these sums payable to the beneficiaries, at the death of the employes thus insured.

NEW TIRE VALVE PATENT.

On May 15, 1917, patent No. 1,226,608, for Tire Valve, was issued to the Scoville Manufacturing Co., assignor of John Lines, of Waterbury, Connecticut. The application for this patent was filed in the Patent Office on October 18, 1897, but through an unusual situation in the Patent Office was not issued until May 15 of the present year. The owners of the patent, the Scoville Manufacturing Co., and A. Schrader's Son, Inc., who are licensees under the patent, were apparently under the belief that the patent had been actually issued, until upon investigation it was found that the issue had not taken place. This unusual situation apparently occurred through no fault of the Scoville company or its licensee, and upon the facts being presented to the Patent Office the patent was duly and legally issued.

THE EAGLE RUBBER CO. EXPANDS.

The new factory building of the Eagle Rubber Co., Ashland, Ohio, shown herewith in a bird's-eye view, is constructed mainly of brick and steel, with a floor space of approximately 25,000 square feet and track frontage of 146 feet. It will be ready for occupancy October 1. Toy balloons are the principal product

of the Eagle company and this addition to its plant will allow for an output of 200,000 of these balloons per day, permitting as well the manufacture of various other items contemplated for the near future.

STANDARD MALKONITE.

Standard Malkonite is a new product that is recommended by the Standard Malkonite Co., Arrott Building, Pittsburgh, Pennsylvania, for a variety of purposes. It may be used in the manufacture of puncture-proof tires for automobiles, motor-cycles and bicycles. It is said to be adaptable as an insulator for electric wires, conduit tubing, switch-boards, signal insulations, and battery jars. Also it is claimed to be an available material for typewriter platens, ten pin balls, acid proof jars, soles and heels.

NEW INCORPORATIONS.

Avalon Rubber Manufacturing Co., The, July 13 (Ohio), \$50,000. J. F. Hower (president and general manager); L. B. Turner (secretary); W. W. Spears (treasurer). Principal office is in Akron, and the factory will be located at Barberton—both in Ohio. To manufacture molded rubber goods, including the more popular articles in the molded mechanical line.

Bay State Insulated Wire and Cable Co., The, July 21 (Boston), \$300,000. J. H. H. McNamee, M. M. L. McNamee—both of 600 Blue Hill avenue; H. E. McNamee, 1509 Blue Hill avenue, M. J. Cashman, 1 Arborway Court—all in Boston, Massachusetts; J. S. Cashman, 643 Canal street, Manchester, New Hampshire. To manufacture and deal in wire and cable products, and articles made in whole or in part of rubber, leather, etc.; also to manufacture and deal in machinery or electrical or hardware supplies.

Century-Plainfield Tire Co., August 17 (New Jersey), \$100,000. C. P. L. Huston, J. D. Grant and W. F. Hart—all of 902 North avenue, Plainfield, New Jersey, which is the address of the principal office of the company. To manufacture, buy, sell, repair, convert, alter, let or hire and deal in tires and inner tubes for tires of every class and description, for use on motor vehicles and other vehicles of every kind, mechanical rubber goods, rubber packings, rubber appliances, and any and all articles of every name, nature and description wherein or in connection with which rubber or rubber compounds or any by-products of rubber are or may be used, etc.

Community Rubber Co., July 26 (Indiana), \$3,150. H. A. Geller (secretary), 167 So. Broad street; E. L. Royall (director), 22 Brynmawr avenue; R. J. Stokes, 833 W. State street—all in Trenton, New Jersey.

Consumers Tire & Tube Co., The, August 3 (Wisconsin), \$10,000. W. S. Mason, G. L. Blum and G. F. Blum. Principal office located at Eau Claire, Wisconsin. To buy and sell automobile tires and accessories.

Continental Tire & Rubber Co., The, August 20 (Delaware), \$300,000. C. L. Rimlinger, F. A. Armstrong—both of Wilmington, Delaware, and C. M. Egner, Elkton, Maryland. Principal office within the State of Delaware is with the Corporation Trust Co. of America, 486 du Pont Building, Wilmington, Delaware. To manufacture, produce, buy, sell, import and generally deal in rubber and gutta percha.

Dunbar-Daggett Co., The, July 31 (Massachusetts), \$10,000. J. F. Dunbar (president); H. A. Daggett (treasurer)—both of 89 Mt. Vernon street, Boston, Massachusetts; and W. A. Thibodeau, Stoneham, Massachusetts. To manufacture and deal in crude rubber or any of its allied products.

Ideal Wheel & Tire Co., August 4 (New Jersey), \$50,000. M. Munzer, 430 E. 141st street, New York City; H. Small, 547 S. 12th street; J. H. Dwork, 217 W. Kinney street—both in Newark, New Jersey, which is the address of the principal office of the company. To manufacture automobile wheels and tires.

International Fibre Co., The, August 14 (New Jersey), \$200,000. Peter E. Wurfflein, William Keegan, LeRoy W. Skelton—all of Trenton, New Jersey. To make, purchase, and sell rubber and rubber fibre soles, heels, mats and all goods of which rubber or fibre are component parts, etc.

Legeim Rubber Co., July 25 (New Jersey), \$25,000. A. McMahon, C. B. Hermans, and F. Losche—all of 1 Montgomery street, Jersey City, New Jersey. Principal office located at 519 Bergen avenue, Jersey City, New Jersey. To manufacture, purchase and sell rubber goods of any and every kind, including automobile tires, tubes and shoes, and all goods of which rubber is a component part.

Lockwood Compound Co., August 4 (Massachusetts), \$20,000. A. Millen, 44 Elm avenue, Wollaston; R. Litchfield, 12 Worcester square, Boston; J. A. Hay, 381 Talbot avenue, Dorchester—all

in Massachusetts. Principal office, Boston, Massachusetts. To manufacture and deal in all products and by-products of rubber and rubber compounds.

Mogul Tyres, Inc., of New England, August 7 (Delaware), \$250,000. C. A. Cole, Hackensack, New Jersey; A. R. Oakley, Pearl River, and Wm. E. Schiels, Jr., 153 Division avenue, Brooklyn—both in New York. The office of the corporation within the State of Delaware is with the Registrar and Transfer Co., 900 Market street, Wilmington, Delaware. To manufacture and deal in automobile tires, goods, wares and merchandise.

Multi-Life Tube & Rubber Co., Inc., August 13 (New York), \$90,000. C. W. Blanford, 452 Fifty-sixth street; C. D. Quick, 25 Clinton street, and I. D. Hamilton, 452 Fifty-sixth street—all of Brooklyn, New York. To manufacture rubber tubes and tires.

Muskogee Tire Repair Co., July 18 (Oklahoma), \$1,400. R. Y. Edwards, G. F. McIntyre and C. M. Cagle—all of Muskogee, Oklahoma, where the principal office is located. To buy, sell, and deal in all classes of automobile tires and to repair the same.

Pan-American Rubber Co., The, July 2 (Wisconsin), \$200,000. Joseph Huebner, Sr., (president and general manager); Joseph Huebner, Jr., and Louis E. Fichaux—all of Milwaukee, Wisconsin. Principal office, 409-411 Third street, Milwaukee, Wisconsin. To deal in rubber and all goods and products of which rubber shall be a component part and to operate processes for the manufacture of rubber, etc.

Petley Rubber Manufacturing Co., July 20 (Wisconsin), \$100,000. J. R. Petley (president and treasurer); F. J. Edwards (vice-president); L. S. Pease (secretary); L. M. Nahin. Principal office, Milwaukee, Wisconsin. To manufacture a complete line of molded mechanical rubber goods, rubber heels, etc.

Robertson Rubber Co., Inc., August 13 (New York), \$5,000. J. A. Lynch, West New Brighton; John Aigeldinger, West New York, and John Robertson, Union Hill—both in New Jersey. To manufacture rubber goods of all kinds.

Rotary Tire Service Co., June 24 (Michigan), \$15,000. E. W. Stuber, 24 Garfield avenue; N. G. Currie, 38 Hanover street; H. G. Baker, 119 Willis avenue, West; W. N. Warren, Holmcroft, Grosse Isle—all in Detroit, Michigan. Principal office, 759 Cass avenue, Detroit, Michigan. Buying, selling and repairing automobiles, acquiring and maintaining a gasoline and lubricating oil supply station.

Shenango Tire Co., Inc., August 10 (Delaware), \$300,000. W. A. McCoy, Pittsburgh, Pennsylvania; W. I. N. Lofland, Charles H. Jones—both of Dover, Delaware. Principal office within the State of Delaware is with the Capital Trust Co. of Delaware, Dover, Delaware. To make and deal in auto tires.

Sterns Tire & Tube Co., July 6 (Iowa), \$100,000. A. A. Schneiderhohn (president and secretary); P. Simones (vice-president); G. J. Timmerman (treasurer). Principal office, Dubuque, Iowa. Manufacturing, jobbing and wholesaling auto tires and vehicles.

Sternwear Tire Sales Co. of Minnesota, August 6 (Delaware), \$150,000. G. L. Rimlinger, M. M. Clancy—both of Wilmington, Delaware; C. M. Egner, Elkton, Maryland. The office of the corporation within the State of Delaware is with the Corporation Trust Co. of America, Dupont Building, Wilmington, Delaware. To manufacture and deal in automobile tires, tubes, and particularly the "Sternwear Inner Tube."

Sternwear Tire and Tube Co. of Oklahoma, July 9 (Oklahoma), \$60,000. C. F. Andersen, F. H. Grant and W. MacRae—all of Oklahoma City, Oklahoma. Principal office, 602 N. Hudson street, Oklahoma City, Oklahoma. Manufacturing, wholesaling and retailing automobile tires and tubes and automobile accessories.

Watkins Tubeless Air Cooled Auto Tire Co., August 13 (Delaware), \$1,000,000. T. C. Watkins, Ingram; W. Burnside, Pitts-

burgh—both in Pennsylvania; M. Howells, Orrville, Ohio. The office of the corporation within the State of Delaware is with the Capital Trust Co. of Delaware, Dover, Delaware. To manufacture and deal in automobile tires and tubes, and goods manufactured from rubber.

Wheeler Rubber Co., The, July 16 (Nebraska), \$25,000. A. E. Wheeler, M. Wheeler, R. E. McLeester. Principal office, Omaha, Nebraska.

LEE TIRE COMPANY IN NEW YORK OFFICES.

The general offices of the Lee Tire & Rubber Co., including all branches of the company's business except the production department, are to be moved from present quarters at the Conshohocken, Pennsylvania, factory to New York City. By October 1 the sales, executive and accounting forces will be installed in New York headquarters and the opening in New York of a large branch service station for the convenience of dealers in the vicinity and New England is also contemplated. These important changes will aid in the greatly increased output of Lee tires promised for next season.

LAUNCHING OF LONG-WEAR TIRES AND TUBES.

The new factory of The Long-Wear Rubber Co., Elyria, Ohio, is now completed and most of the machinery installed, the total cost being \$100,000. Within another month the company's product—automobile tires and tubes—will be on the market. At the last meeting of the board of directors, officers were elected as follows: William Seher, Lorain, Ohio, president; J. E. Murbach, Elyria, vice-president; I. N. Barber, Chicago, Illinois, secretary; W. E. Brooks, Elyria, treasurer; Charles J. Hodges, Elyria, general manager. Other directors are Henry B. Kishman, Vermilion, Ohio; J. J. Dauch, Sandusky, Ohio; C. H. Whitney, Oberlin, Ohio. B. W. Rote, Akron, Ohio, is factory manager.

CONVEYOR BELTING STRONGER THAN STEEL CABLE.

About the middle of June there were stored at the docks at St. John, New Brunswick, thousands of cases of shells waiting to be shipped for use abroad in the present war. So great was this weight that the wharf collapsed, not toppling over but simply

RUBBER CONVEYOR BELT HOLDING IMMENSE WEIGHT.

dropping straight down under the load. Over this warehouse was a grain conveyor having a rubber conveyor belt. When the warehouse collapsed this grain conveyor remained suspended in the air by the strength of the belt, which carried the weight of the conveyor, and when the second tide caused a further crash this tower slid along the belt until it reached Shed No. 5, as shown in the photograph. The authorities did not consider the belt sufficient to hold this great weight, and provided heavy steel cables to prevent further collapse. After these cables were placed the belting was cut, but when the next tide came in the cables broke and the conveyor came down with a crash. Rarely, if ever,

has there been a more severe test for a belt of this kind, or, in fact, almost any kind of a belt, and that it stood the test speaks volumes for the quality and workmanship of the manufacturer, the Canadian Consolidated Rubber Co., Limited, of Montreal, Canada.

TRADE NOTES.

Cutler-Hammer Manufacturing Co., Milwaukee, Wisconsin, has made the gift of a fellowship of \$400 for research work in physics to the University of Wisconsin, Madison.

The Canton Rubber Co., Canton, Ohio, has surrendered its certificate of authority to do business in the State of New York as a corporation, and the products of the company will in future be handled in that section exclusively by Lloyd P. Jones, 240 Broadway, New York City.

The United States Rubber Co. has bought 40,000 shares of its own stock and turned them over to employees on a profit-sharing plan.

The Federal Rubber Co., Cudahy, Wisconsin, held its annual picnic on August 18 at Waukesha Beach. There was an attractive program of athletic events and a flag-raising ceremony.

The Rubber Regenerating Co., Mishawaka, Indiana, has employed a number of women to take the places of men expected to be called under the draft law. It is said that the services of the women, who are doing regular routine work, are proving highly satisfactory.

To the McCoy-Nolan Supply Co., Milwaukee, Wisconsin, has been awarded the contract to supply the local fire department with 5,000 feet of 2½-inch double-jacketed fire hose; also the contract for 1,000 feet of 3½-inch fire hose.

The semi-annual style conference of the clothing department of the United States Rubber Co. was held at Grand Pacific Hotel, Chicago, Illinois, the first part of August, when a wonderfully attractive line of clothing, was shown for the examination of the buyers of the branch stores.

The United States Rubber Co. of California arranged a very attractive display of druggists' sundries at the recent convention of the California Pharmaceutical Association in San Francisco, this being the only exhibit of druggists' rubber goods. Mr. Van Inwagen, manager of that department, reports that the druggists evinced much interest in the display.

While the word "Substitute" has a definite and well-understood meaning in the rubber manufacturing industry, the term is undoubtedly suggestive of adulteration. The Stamford Rubber Supply Co., Stamford, Connecticut, has therefore adopted for its vulcanized vegetable oil products the term "Rubber Factice."

The Traun Rubber Co. has recently removed its offices to 239-243 Fourth avenue, New York City.

The Rubber Regenerating Co., Naugatuck, Connecticut, is erecting a new three-story brick warehouse, 320 by 66 feet, which will be used for manufacturing as well as warehouse purposes. The company is also building a 200- by 62-foot warehouse at its factory at Mishawaka, Indiana.

S. Birkenstein & Sons, scrap rubber dealers, Chicago, Illinois, have recently purchased from fifty to sixty thousand square feet on North avenue and Hawthorne street. No definite plans for building on this property have yet been formulated.

The Keystone Tire & Rubber Co., Inc., New York City, is now operating 32 stores and at its annual meeting on August 1 the board of directors resolved to continue opening stores until a maximum of 100 is reached. There were no new elections.

St. Louis, Missouri, appears to be on the very threshold of industrial opportunity. The "St. Louis Chamber of Commerce Bulletin" of late has an unusually optimistic tone and may prove an inspiration to new manufacturing business seeking a promising site.

HENRY N. MABERY.

HENRY NELSON MABERY, treasurer of The Savage Tire Corp. of San Diego, California, was born in Winchendon, Massachusetts, and educated in the Murdock Schools in that

H. N. MABERY.

town, which is noted for the extent of its wood working industries. In his youth he acquired a practical knowledge of every branch of the wood working machinery business, first with Baxter D. Whitney & Sons Co., of Winchendon, and later with the S. A. Woods Machine Co., of Boston, Massachusetts, and he had already assumed a prominent position in this industry when the state of his wife's health prompted his moving to a less rigorous climate. Twelve years ago

he took up his residence at Los Angeles, California, where for ten years he engaged in the real estate business, and the beautiful sub-division between Los Angeles and Hollywood, named Mabery Heights, is a permanent testimonial to his development work. In August, 1915, the Savage Tire Co., of San Diego, California, secured the services of Mr. Mabery for some special organization work, and the promptness and thoroughness with which this work was performed led eventually to his being appointed to a prominent position in the Savage organization, and he is now general superintendent of the Savage Tire Co., and secretary and treasurer of The Savage Tire Corp. During the period of Mr. Mabery's supervision the business of the company has grown so as to require very material enlargement, the addition of many modern machines and the installation of the latest manufacturing methods, and much of this is due to his business insight, activity and enterprise.

GOODYEAR PROMOTIONS.

The Goodyear Tire & Rubber Co., Akron, Ohio, has made the following changes in its branch managers:

B. S. Waterman, formerly branch manager at Boston, Massachusetts, has been placed in charge of the solicitation of manufacturers' business in all departments for the New England district.

W. A. Hazlett, formerly manager of the Detroit, Michigan, branch, has been appointed manager of the Detroit district.

P. E. Ammon, who has been special dealers' representative of the Detroit district, becomes assistant to Mr. Hazlett.

H. G. Norris, formerly manager at Toledo, Ohio, has been promoted to the management of the Detroit branch.

G. H. Hilbish has assumed charge of the Toledo branch, and is succeeded at Saginaw, Michigan, by W. D. McFarland, formerly a salesman in that territory.

F. W. Telford, who has been manager at Des Moines, Iowa, has been assigned to the manufacturers' division at Detroit.

R. E. Greene, former assistant manager at Minneapolis, Minnesota, succeeds Mr. Telford at Des Moines.

UNITED STATES RUBBER CO. APPOINTMENTS.

Recent appointments of the United States Rubber Co., New York City, include the following in the branch store department: Arthur W. Lawrence is made assistant to manager.

George E. Goodwin is promoted to supervisor of clothing and druggists' sundries.

Charles A. Blake becomes supervisor of footwear. He will continue to act in an advisory capacity on salesmen's operations.

T. B. Goodloe is now supervisor of tires.

W. C. Peterson, supervisor automobile accessories; and

E. P. Cole, supervisor of mechanical goods.

PREFERRED STOCK FOR FEDERAL RUBBER EMPLOYEES.

As the result of requests from many of the employees of the Federal Rubber Co., of Cudahy, Wisconsin, for the privilege of purchasing an interest in the company, action recently was taken by the board of directors whereby a certain amount of second preferred stock of the company might be acquired. This stock, which is dividend-bearing, will, by reason of the limited number of shares available, be offered primarily to those employees holding positions of responsibility and whose terms of service with the Federal company cover a considerable period of time.

A BICYCLE TIRE WINDOW DISPLAY.

The United States Rubber Co. has in its building, 1790 Broadway, New York City, some of the best show windows in the city, both in the arrangement of the windows and the location for exhibiting the class of goods it carries. Last month all of its windows were fitted with tires of various kinds and grades made by the company, and the arrangement of the windows certainly proved that whoever had this in charge was a

real artist. Reproduced here is the display in one of the windows, which reminds one of the song, "The Old Oaken Bucket," it being intended to advertise bicycle tires. There was an ingenious blending of painted background with real flowers and shrubbery. Two bicycles were shown, together with tires having a variety of treads made by this company. Two children were represented as resting from their pedaling and quenching their thirst at the old well, and no doubt thousands stopped to study this and incidentally realized that the company manufactures quite a variety of bicycle tires.

The strength of France, commercially and financially, is briefly outlined in a booklet, "France and America, Their Mutual Interests and Obligations," published by the Guaranty Trust Co., of New York City, and which will be read with interest by exporters.

PEARCE ARROW TIRE COMPANY CHANGES ITS NAME.

At a meeting held on August 20 the stockholders of the Pearce Arrow Tire & Rubber Manufacturing Co. voted to change the name to Pearce Rubber Corporation and to increase the capital stock to \$1,000,000. The company now has ample working capital, in addition to paying for new machinery and equipment for its new factory, which will have a capacity of 1,000 tires per day.

TRADE NOTES.

The frequently recurring rumor, with ever-varying details, that the Ford Motor Co., Detroit, Michigan, is to manufacture tires for Ford cars remains without foundation in fact. The extensive building operations now in progress in the River Rouge district led to the belief that a separate tire making company was to be organized to conduct this enterprise on a separate basis, but THE INDIA RUBBER WORLD is advised that the Ford company does not contemplate increasing the size of its rubber department at the present time. Serious consideration has not been given to this matter, due to the enormous expansion of other departments with which the company is more familiar. However, experiments with tires and molded goods still continue and a limited quantity is turned out daily.

The Aero Cushion Tire Co., San Jose, California, has come under new management and is turning out tires to the full capacity of the plant. The new officers and directors are as follows: B. A. Herrington, president; A. P. Marston, vice-president; E. L. Sherbondy, superintendent; W. P. Wholhete, secretary; J. J. O'Shannessy, general sales agent.

Mention has previously been made in THE INDIA RUBBER WORLD of the complaints of several rubber companies against unfair railroad freight classification. The hearing in three of these cases assigned for September 22 at Akron, Ohio, has been postponed by the Interstate Commerce Commission, Washington, D. C., to a date to be hereafter fixed. The companies concerned are as follows: The Goodyear Tire & Rubber Co. v. The Akron, Canton & Youngstown Railway Co. *et al*; Kelly-Springfield Tire Co. v. The Akron, Canton & Youngstown Railway Co. *et al*, and The Batavia Rubber Co. v. Erie Railroad Co. *et al*.

The Consumers Service Tire & Equipment Co., Fulton, Illinois, incorporated under the laws of South Dakota, November 21, 1916, with a capital stock of \$5,000,000, has changed its name to Lincoln Highway Tire Co.

The Fisk Rubber Co., Chicopee Falls, Massachusetts, announces the opening of a new branch and service station at 212-14 S. Pinckney street, Madison, Wisconsin, on or about September 1.

The Osborne Engineering Co., of Cleveland, Ohio, has planned a factory for The Ideal Tire & Rubber Co., to be located at Warren Road, Cleveland, on a 75-acre tract. The plant will have three stories and basement and it is reported will cost \$150,000.

It is estimated now that the Mid-Continent Tire Manufacturing Co., Wichita, Kansas, will commence operation on September 10. Three Akron, Ohio, rubber men—W. E. Greer, R. E. Riley and B. L. Pontius—are to have charge, respectively, of the factory management, mill room and tube department.

The Johnstone Tire Co., of La Porte, Indiana, will manufacture a semi-solid tire adapted for delivery wagons. The tire, which is the invention of Samuel Johnstone, for whom the company has been named, carries a 10,000-mile guarantee.

The Sterling Tire Corp., Rutherford, New Jersey, which succeeded the Rutherford Rubber Co. last March, held its semi-annual convention of managers and salesmen on July 27 and 28, a feature of the occasion being the presentation of medals and prizes to members of the force for their accomplishments during the first six months of the year.

THE NEW FACTORY OF TUCKER MILLS, INC.

Such rapid progress has been made by Tucker Mills, Inc., Baltimore, Maryland, that the company has moved into new and larger quarters. The accompanying illustration shows the first plant, now outgrown. This business was started with six looms in April, 1916, as the Monumental Manufacturing Co., and was incorporated under the laws of Maryland in April, 1917, as Tucker Mills, Inc. Carded peeler fabric for cord tire construction has been the exclusive product, and so great has been the demand that, with the new facilities and machinery to be in operation in October, the output will be increased to 15,000 pounds weekly.

The officers of the company are: E. D. Hewins, president, Boston, Massachusetts; J. E. Tucker, vice-president and general manager, Baltimore, Maryland; Albert A. Blakeney, treasurer,

Baltimore, Maryland. All are men of long experience in the cotton duck and tire fabric trade. The product of the mill is sold through E. D. Hewins, 72 Lincoln street, Boston, Massachusetts.

OHIO RUBBER SHIPPERS ORGANIZE.

The Northwestern Ohio Rubber Shippers' Association has been formed to enable those firms engaged in shipping crude rubber and rubber products in the Akron territory to act jointly in handling the traffic problems that are continually arising and in which all have a common interest. It is also hoped that this association will furnish a convenient medium of cooperating with the railroads in effecting changes and improvements in traffic conditions.

The present Akron members include The B. F. Goodrich Co., Firestone Tire & Rubber Co., The Goodyear Tire & Rubber Co., The Miller Rubber Co., and General Tire & Rubber Co. Other members are the Portage Rubber Co., Barberton, Ohio; McGraw Tire & Rubber Co., East Palestine, Ohio; Marathon Tire Co., Cuyahoga Falls, Ohio; The Republic Rubber Co., Youngstown, Ohio.

The officers are as follows: F. C. Van Cleef, president; E. C. Knox, vice-president; E. L. Tragesser, treasurer; executive committee, R. G. Kreidler, chairman, E. L. Morgan, H. S. Bryant, E. C. Knox, E. L. Tragesser, A. C. Redman, L. H. Ley, W. D. Morris.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent

PERHAPS the latest and most reliable statistics regarding Akron's great rubber industry were given in an article for the July issue of "Export American Industries," by Vincent S. Stevens, secretary of the Akron Chamber of Commerce. This article entertainingly reviews the phenomenal growth of this "city of opportunity," its present variety of industry and extent of civic and social work and improvement. It is pointed out that in addition to its gigantic rubber goods factories, Akron has one of the largest cereal mills in the United States, very extensive clay product plants, large book publishing houses, extensive furnace factories, important agricultural implement interests, and one of the largest fishing tackle factories in the world.

Regarding the rubber industry, Mr. Stevens writes:

The first rubber factory in Akron was established in 1869, in a building 40 by 100 feet in size, with 25 employees. Akron at that time was a town of 10,000 inhabitants with a somewhat limited reputation as a promising town of cheap canal transportation. This pioneer company has grown to be the largest rubber factory in the world, employing at the present time 19,000 persons and covering a floor space of 90 acres. It is said that this company makes no less than 8,000 different and distinct articles. Other rubber companies have multiplied until there are now 24 active companies in Akron, with a combined output of 50,000 tires and an equal number of tubes per day, besides immense quantities of rubber clothing, boots and shoes, hose, belting, surgical and druggists' goods, and an almost innumerable variety of other hard and soft rubber articles. These companies have an aggregate capitalization of \$171,000,000, and employ a total of 55,000 persons. Of the total of 120,000 tons of crude rubber imported into the United States in 1916, 60,000 tons were consumed by the Akron factories. Of the estimated demand of 20,000,000 tires needed this year for the 4,000,000 automobiles in use in this country, 15,000,000, or 75 per cent, will be made in Akron.

* * *

Labor Day for Goodrichites will be a dizzy round of pleasure, according to the plans for the second annual field day of The B. F. Goodrich Co. The varied activities will appeal to all tastes, and there will also be novel features, such as a "secret" handshaker, who will pass \$10 to the fiftieth person shaking hands with him during the day. The program of events includes the following:

Folk Dances—Russian, Macedonian, Croatian, Lithuanian, Italian Tarantella; fencing exhibition; tableaux and national dances; soccer—Goodrich "Bearcats" vs. Goodrich "Tigers," prize of \$27.50 to winning team; numerous track and field events for men, and special events for women, with money prizes for each event; horseshoe pitching contest, prize of \$10 to the winner; tennis singles and doubles for both men and women, \$5 prize; cricket—Goodrich "Eagles" vs. Goodrich "Hawks," prize of \$27.50 to winning team.

* * *

The Goodyear Tire & Rubber Co. will also hold a big picnic and field day at Seiberling field on Labor Day, for which many events are being planned.

The Goodyear motor truck service from Akron to Boston has proved a decided success and four large trucks are now used, carrying tires to the East and returning laden with tire fabric from the Goodyear Cotton Mills, at Goodyear, Connecticut.

* * *

The August issue of "The Firestone," the house-organ of the Firestone Tire & Rubber Co., contains an interesting editorial entitled "Open Wide the Windows of Your Mind," in which all-round development and breadth of vision are urged as valuable assets for the men who make a business of the manufacture and sale of tires.

* * *

The total volume of business done by the Miller Rubber Co. in the first 7 months of 1917 shows an increase of approxi-

mately 85 per cent over the corresponding period of last year. In 1916 the volume between January 1 and August 1 amounted to \$3,599,000. In the corresponding period of this year, the total volume amounts to \$6,605,000.

The comparative sales for each month are as follows:

	1916.	1917.
January	\$416,780	\$706,160
February	347,786	774,646
March	503,755	856,257
April	466,145	1,082,869
May	555,597	1,055,216
June	658,768	1,091,162
July	650,205	1,039,463
	\$3,599,037	\$6,605,776

* * *

The Mohawk Rubber Co. recently completed an addition to its factory and has installed new equipment, including boilers, mills and calender. A permit has been secured to build a new garage, to cost approximately \$30,000, to house the company's cars and trucks and those of some of the employees who use their cars in going back and forth to work. This building will also include a carpenter shop and some additional storage space, and will be constructed of brick, iron and concrete. The Mohawk company is now running to full capacity, and by the addition of some curing capacity will probably increase its production about 20 per cent during the coming year.

* * *

The Kendall Tire & Rubber Co. has purchased the factory and equipment of the Meyer Rubber Co., at Massillon, this state.

* * *

The O'Neil Tire & Rubber Co. has increased its capital stock from \$25,000 to \$100,000, in order to finance its rapidly growing business. Plans have been completed for a new factory building which will increase the present space fivefold. The O'Neil company manufactures tire accessories, air bags and tire repair equipment, and intends adding the manufacture of soles and heels and other rubber specialties to its lines.

* * *

In order to conserve its resources and not draw on capital and surplus at the present time, The Swinehart Tire & Rubber Co. recently paid its regular quarterly dividend of 1½ per cent on common stock in new preferred stock script instead of cash. The company took action early in the Spring to authorize an issue of \$500,000 preferred stock, anticipating the conditions that have since prevailed, but owing to the declaration of war on April 12, the issue could not be floated except at a sacrifice, which the company did not feel it advisable to consider.

* * *

H. Q. Tennant has been given charge of sales in the home office of The American Rubber & Tire Co. Mr. Tennant has had considerable experience with several of the larger rubber factories, principally in sales promotion work.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

THE rubber plants in Rhode Island are running at capacity, following necessary shut-downs for stock taking, overhauling and repairs of machinery, etc. Notwithstanding the fact that the production from every plant is far in excess of that ever before credited to them they are still behind their orders, and indications are that the rush will continue for months to come.

* * *

The Alice Rubber Shoe Mill, of the Woonsocket Rubber Co., at Woonsocket, which employs 1,500 operatives, resumed operations on August 17, and the Millville rubber mill and the felt mill of the same company, at Millville, are now in full operation after the vacation period.

* * *

After a shut-down from August 13 to 20, business at the

American Wringer Co., Woonsocket, is driving and great difficulty is being experienced in producing an output that will maintain anywhere near an equalizing pace with the orders that are being received. For the first time in its history the concern has introduced female help in its factory, 12 entering the finishing room during the past month. They are employed in tying the guarantee tags and doing light varnish work, and if the experiment proves successful, Manager J. P. Walsh states that the firm will employ more girls in some of the departments.

* * *

Percy A. Greenwood, assistant foreman in the finishing department of the American Wringer Co., concluded his duties on August 11, having passed his examinations for the National Army. He was presented a sum of money by his fellow foremen and office force.

* * *

Assistant Superintendent Charles J. Burns, of the Tubular Woven Fabric Co., Pawtucket, a member of Battery B, Rhode Island Battalion of Light Artillery, and Michael Cresendo, overseer of the paper room and a member of Battery C, were called into service the past month and are now with their commands at the mobilizing camp at Boxford, Massachusetts. Previous to their departure they were tendered a farewell reception, and a number of articles that will be useful and valuable to them during their service were presented by William Whitaker, a member of the office force.

* * *

The National India Rubber Co., at Bristol, is repairing and improving its property, and is overhauling and installing machinery. A substantial granolithic sidewalk, more than 800 feet in length, has been completed in front of the entire factory. A granolithic retaining wall, the length of the mill, has been constructed, which will be surmounted by an ornamental iron railing. Piers at each side of the main entrance will hold electric lights in ornamental brackets. Trees are to be planted in the spaces near the curbing along the walk to take place of those recently removed.

An important improvement is the enlarging of the boiler house, which will soon be completed. The upper part of the old boiler house is to be extended 10 feet higher, the addition to be of brick, with steel trusses and topped by a sheet iron roof. Plans have also been completed and bids are being asked for the erection of a new brick manufacturing building, three stories high, on which work is to be commenced at as early a date as possible.

* * *

Following their vacation periods, the daily output of rubber footwear from the National India Rubber Co.'s plant at Bristol averages 49,000 pairs, and the Narragansett Rubber Co., of Bristol, 14,000 pairs.

* * *

The O'Bannon Corporation, formerly known as the International Rubber Co., at West Barrington, is adding a number of calenders, and other new machinery is being installed to meet the increasing demand.

* * *

A fire, early last month, in the chemical room of building No. 2 threatened the entire plant of the Revere Rubber Co. It probably started from an explosion, which shattered containers and liberated a considerable amount of acid. Employees trying to hold the flames in check were overcome by the acid fumes, as were also, later, several firemen. The promptness of the fire department saved the plant from a repetition of the disastrous and fatal fire at this plant in 1912, but the loss of stock was considerable.

The Revere company is making extensive alterations and additions to its three-story factory building on Valley street.

* * *

The first dividend of 10 per cent in the matter of the Cataract Rubber Co., of Providence, has been declared by Referee in

Bankruptcy N. W. Littlefield and is now being paid to the creditors of record.

* * *

The Hope Webbing Co., Pawtucket, which is one of the largest manufacturers of narrow woven and braided fabrics in the country, is installing a number of new looms which, it is claimed, will increase the plant's production nearly one-third. The concern already operates between 1,000 and 1,100 looms and 250 braiders.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

At a recent meeting of the Hood Rubber Co., Watertown, an increase of preferred capital stock of \$2,250,000, and an increase in common capital stock of \$1,000,000 were authorized. The preferred stockholders voted unanimously to exchange the old preferred stock for new preferred stock, share for share.

The directors have voted to issue 12,500 shares of preferred stock, and a large amount of this stock has already been subscribed for. They also voted to issue 5,000 shares additional common stock for subscription at par to holders of common stock of record at the close of business August 11, with rights to subscribe for one new share for every five old shares. It has been deemed advisable to terminate the voting trust which held a large majority of the common shares of the company, and the voting trust certificates are being called in for exchange for shares of the common stock of the company.

The Hood Rubber Co. is now showing a line of tennis shoes for the season of 1918 which includes a number of styles furnished with the pneumatic rubber heel on which the company own the patent. The Hood company claims to be the first to manufacture heel tennis shoes and also the first to exploit tennis shoes with the high Louis or Cuban heel similar to leather shoe styles for women. Another novelty is a line of workmen's and children's shoes with duck upper and rubber and fiber soles, which are expected to have a wide sale because of the high cost of leather footwear. This concern is vulcanizing its tennis lines under the pressure cure. Orders are already piling up for January to March delivery, and the tennis department is being run to capacity to enable the company to ship at dates indicated.

* * *

The Boston Woven Hose & Rubber Co. now has, at its factory in Cambridgeport, a fully equipped first aid hospital for the immediate treatment of employees who may be taken ill, or

injured. A trained nurse and an assistant are in constant attendance, and a physician is at the plant every day between 8.30 and 10 A. M. Safety stations have been established at convenient points in the various buildings of this extensive plant,

each of which is equipped with a stretcher, blankets, and a first-aid jar with complete supplies. At the hospital two rooms are provided and the equipment consists of an operating table of white enameled iron, bed and chairs of the same, an instrument cabinet of plate glass and white enameled iron frame, a medicine cabinet, chest of drawers for bandages and supplies, a sterilized white enameled sink, hot and cold water and all necessary instruments. Even such late inventions as the French Ambrine treatment, and Dakin's new antiseptic are provided. For such surgical cases as are beyond the scope of this factory hospital, arrangements have been made for immediate ambulance service, and provision for treatment at a local hospital, where beds have been engaged for workers who may be injured in the service of the company.

* * *

The Apsley Rubber Co. is very busy on manufacturing rubber blankets for the United States soldiers who have gone or are about to go to France, and although the company has a large amount of orders for its regular lines, these have been side-tracked in order to deliver the army goods in as large quantities and at as early dates as possible. Mr. Apsley, in a recent interview, said:

My plant is at the disposal of the United States Government for the manufacture of articles needed for the Army and I have made this offer in a spirit of patriotism. My company does not want to reap wartime profits but it wants to be of help in a time of the country's great need.

In the old days men enriched themselves when the nation was at war, but I would prefer to abandon this big plant built up during thirty-two years of endeavor rather than submit an inferior article to Uncle Sam for the use of the boys who are fighting our battles.

Our growth here is something we are proud of and we are going to cling to the old traditions.

* * *

Mention has frequently been made of the athletic activities of the employes of The Fisk Rubber Co., Chicopee Falls, this state, and of Fisk Park, the thirty-acre recreation ground, where ball games, amateur and semi-professional, are played every Saturday. In addition to its two base ball diamonds, three tennis courts, and a half-mile running track, a football gridiron has been laid out recently, basket ball courts have been added, and a hand ball court is in process of construction. This enterprise, though fostered by the company, is entirely in the hands of the employes, the expenses being raised by the one dollar membership fees, and by the athletic meets, and entertainments at which admission is charged. The Fisk Red Tops, which is one of the seven baseball teams, will meet several of the Western rubber factory teams of Akron, Cleveland and Detroit during its Western trip this season.

* * *

The Plymouth Rubber Co., Canton, this state, has elected a new board of officers as follows: James A. Clifford, president; Charles W. McDermott, vice-president, and J. E. Stone, treasurer. These and A. Sydeman, J. C. Haartz, W. G. Thomas and Marshall Cutting are the newly elected directors.

Mr. Clifford, the new president of the company, was until recently superintendent of manufacturing and reclaiming for the Boston Woven Hose & Rubber Co., of Cambridge, at its Plymouth plant. Previous to his nine years' service with that company he was connected with the United States Rubber Reclaiming Co. at Naugatuck, Connecticut, and his scientific and chemical education and practical experience make him a valuable acquisition for the Plymouth Rubber Co.

W. E. Kavenagh, the new factory manager of the Plymouth company, has been connected with the rubber business ever since 1899, and in 1900 was employed by The Goodyear Tire & Rubber Co., Akron, Ohio, as foreman, which position he left to take a four years' course at Harvard University, when he again

entered the employ of that company, taking charge of the chemical laboratory and deresinating plant, afterwards going as superintendent of the Goodyear plant in Canada. Just previous to his present connection he was associated with the Swinehart Tire & Rubber Co., Akron, Ohio, as general superintendent.

A general line of mechanical rubber goods will now be developed in addition to the present product. It is reported that the Plymouth Rubber Co. did a gross business of \$3,000,000 last year.

CANADIAN NATIONAL EXHIBITION.

The thirty-ninth Canadian National Exhibition is being held at Toronto. Over 1,000,000 visitors are expected. The grounds are situated on the shore of Lake Ontario, and extending along the water front for upwards of a mile, comprise 264 acres. Some of the principal buildings are:

MANUFACTURERS' HALL. Industrial arts and crafts, contains 72,500 square feet of space. A second building has approximately the same area, making a total of 145,000 square feet for the display of manufactured products.

MACHINERY HALL AND ELECTRICAL BUILDING. Heavy machinery and machinery in operation. It is equipped with ample steam power and shafting for the purpose, and has a floor space of 35,000 square feet.

INDUSTRIAL AND PROCESS OF MANUFACTURE BUILDING. A modern brick and steel structure with 76,500 square feet of floor space.

SCRAP RUBBER DEALERS FIGHT NEW YORK JUNK ORDINANCE.

Scrap rubber is included in the list of waste materials specified in the Junk Dealers' License Ordinance recently passed by the Board of Aldermen and approved by the Mayor of New York City. Under the provisions of this ordinance "anyone dealing in the purchase and sale of *** rubber *** in large or small quantities, shall be known as a junk dealer and his place of business a junk shop." Junk licenses must be procured and all merchandise must be kept in their possession at least 48 hours after purchase.

As it is manifestly unreasonable to classify persons engaged in the wholesale rubber business exclusively as junk dealers and to compel them to comply with the rigid provisions of the ordinance, several of the largest New York dealers in rubber scrap have retained Reit & Kaminsky to confer with the Police and License Departments regarding the matter. This law firm was also retained by the Wholesale Wool Stock Merchants' Protective Association and the Associated Dealers in Paper Mills Supplies of New York and succeeded in having the ordinance amended to exclude persons engaged exclusively in the purchase and sale in large quantities of scrap iron and steel, woolen rags and paper stock, and requiring only that each person shall annually file with the Commissioner of Licenses a statement in writing setting forth the name and address of such person and the character of his business. There is reason to believe that scrap rubber dealers will be placed on a similar basis.

THE LENGTH OF THE WORKING DAY.

The question of reduction of the hours of labor in manufacturing establishments is a most important one, and one which is continually being agitated. The National Conference Board is sending out a schedule of inquiries to manufacturers to secure such statistical information on this point as may be available when demands come for a further shortening of the working day. The Rubber Association of America, which is a member of the National Conference Board, is advising its members to fill out the blanks furnished them, and mail them to the office of the Board, 13 Beacon street, Boston, Massachusetts.

The Rubber Trade in Great Britain.

By Our Regular Correspondent.

NOW that we are all in the same boat there is no object in harping upon the altered conditions which war has imposed upon our rubber trade, as no doubt they have now been reproduced in America. The main feature of the moment throughout England is that anybody who has anything to sell does so at an enhanced price, in many cases beyond what is justifiable. The buyer enters a mild protest, but goes on buying, and if he is in business passes on the extra cost to his own customers. This might form an appropriate exordium to remarks on the position created by the recent advances in rubber goods notified by the India Rubber Manufacturers Association, but the subject cannot be ventilated in a few lines, and we are exhorted to be careful in the use of paper.

One of the busiest branches of the trade in non-war goods is the cycle tire department, the cycle having come into its own again in a marked degree, owing to the embargoes on and expense of other forms of locomotion. Moreover, the fine summer which has upset the calculations of the mackintosh and oil-skin makers has been conducive to pleasure cycling.

An unusual incident of the hot weather occurred during a thunderstorm on July 16, when the rubber works of Broadhurst & Co., Limited, Manchester, were struck by lightning and set on fire. The outbreak was soon subdued by the fire brigade and no interruption to business was experienced, but several work-people sustained injuries from broken window glass.

SURGICAL GOODS.

Naturally since the war began there has been an increased demand for surgical goods of various kinds, including what are generally known as druggists' sundries. In this sort of work, especially in certain classes of surgical goods, the French have always been the principal producers, and British surgeons have been in the habit of insisting upon certain articles being of French manufacture. Until quite recently, I believe, the particular American made articles which are now being sold in Britain were not made in America, and it has been suggested that what have been coming to us during the last two years were really of German origin. It is also said that a good deal of what was sold as of German make in pre-war days was really of French origin. The difficulty with the four or five British rubber works which specialize in surgical goods is to get them to make patented specialties. They say the prospective business is not large enough to tempt them to enter into it, and in such cases as they have undertaken, the prices charged for the manufacture of specialties have often been such as to prevent the patentee from doing anything like a large business. At the present time, owing to diminution of staffs and congestion of work, it is not surprising that delivery is much behind hand on orders that have been taken. One consequence of this—and the same thing applies to various other patented rubber goods—is that people quite outside the rubber trade are seriously considering the feasibility of going into rubber manufacture to a certain extent on their own account. This is a development that, when normal conditions return, will probably not commend itself to the large rubber works. They may, of course, console themselves with the thought that the new comers will lose money and be glad to revert to old-time procedure. Though it does not come under my paragraph heading, I may say that an important bicycle manufacturing firm is considering the manufacture of rubber tires.

THE INDIA RUBBER MANUFACTURERS' ASSOCIATION, LIMITED.

The outstanding feature of the statement made by J. T. Goudie, the chairman, at the annual meeting was the fact that

the 30 firms which are now members included such large concerns as Warne, Silvertown, and Scotch firms which had hitherto held aloof. The increase in the membership and the continually widening scope of its work has rendered the formation of various district and sectional committees imperative, and several of these sections, notably those dealing with waterproof garments, have been for some time at work. The general committee of management, which was elected at the meeting, contains several interesting names new to the association: Chairman, J. T. Goudie (Leyland & Birmingham Rubber Co., Limited); vice-chairman, Hugh C. Coles (Wm. Warne & Co., Limited); committee, P. A. Birley (Chas. Macintosh & Co., Limited), W. E. Birrell (Clyde Rubber Works, Limited), J. H. C. Brooking (St. Helens Cable & Rubber Co., Limited), A. Cairns (A. Cairns & Co.), M. Frankenburg (I. Frankenburg Sons, Limited), G. C. Mandelberg (J. Mandelberg & Co., Limited), P. Maclellan (George Maclellan & Co.), David Moreley (David Moreley & Sons, Limited), T. C. Redfern (Redfern's Rubber Works, Limited), Stuart A. Russell (The Silvertown Co.), James Tinto (Irwell & Eastern Rubber Co., Limited). In concluding his address the chairman said that it was very gratifying for the old committee as it retired to make way for a more widely extended representation, to note that all traces of former friction had disappeared and that there prevailed among the whole of the members an excellent spirit of concord and mutual confidence.

THE CHEMISTRY OF VULCANIZATION.

This was the title of a paper contributed by Dr. D. F. Twiss, chief chemist of the Dunlop Rubber Co., Limited, at the Chemical Congress held at Birmingham in July on the occasion of the annual meeting of the Society of Chemical Industry. The paper, which was a long one, cannot be usefully abstracted in the space available and I shall therefore confine myself to noting a few of its items. As a prefatory remark I may say that it is a matter of some international importance to the trade that the Dunlop company, following the lead of the North British Rubber Co., Limited, has abandoned the old established procedure of British rubber manufacturers and has allowed some of its laboratory work to be published and discussed. This is a matter for which the trade will join with the writer in his expressed indebtedness to J. V. Worthington, technical superintendent and director of the Dunlop company.

Owing to the difficulties of dealing with a body which is obtained chemically pure with exceedingly great difficulty, there remained yet many points, he said, in connection with the rubber industry of which the scientific interpretations are contradictory, vague, or based on quite insufficient evidence. Nevertheless, more especially during the last ten years, extraordinary advances had been made in the chemistry of rubber.

In the earlier days of the plantation rubber industry considerable stress was laid on the variability in the rate of vulcanization of plantation Para as compared with wild Para rubber. An explanation was to be found in the discovery of Eaton and Grantham that if the soft slabs of coagulum are allowed to "mature" for several days before the retained serum is expressed the resulting rubber vulcanizes with unusual rapidity, the effect attaining its limit after a period of, roughly, seven days before washing and crepeing. The advantage of a uniform supply of such rapidly vulcanizing rubber for special purposes would readily be recognized, said Dr. Twiss, who added that it should be specially marked for sale. In the subsequent discussion Dr. Stevens, of London, said the labeling of such rubber was of great importance, otherwise the complaints as to vari-

and it would be counter than ever. He added that during maturing oxidation took place, weakening the surface. After discussing the action of inorganic accelerators, Dr. Twiss went on to speak of organic accelerators and said that one of the most powerful of these organic catalysts is aldehyde ammonia, its effectiveness far outweighing what might be expected of its ammonia content. It was a remarkable circumstance that almost the whole of the known effective organic accelerators are basic, their activity depending upon their relative alkalinity. The alkali hydroxides were strong accelerators. For a long time it had been known that alkali reclaimed rubbers vulcanized with exceptional rapidity. It had been shown that a small percentage of powdered caustic potash caused a greatly increased rate of vulcanization in a mixture of rubber and sulphur. He came to the conclusion several years ago that the action of both inorganic and organic acids depended upon their basicity and that the action of the latter was more pronounced only because they were soluble in rubber and therefore more evenly distributed.

Dr. Twiss then went on to describe some interesting experiments he had made with a 25-per cent solution of caustic potash in glycerol. Some results were using a mixture of 95 per cent rubber and 5 per cent sulphur, residual free sulphur 3.6 per cent, with 2 per cent glycerol accelerator 0.31 free sulphur; with 1 per cent aldehyde ammonia 0.17 free sulphur; with 1 per cent para-nitroso dimethylaniline 1.5 per cent free sulphur. The nitroso compound was much more effective in mixings containing a high percentage of sulphur than with those with a relatively low proportion and this would account for its very partial success in low sulphur, litharge or antimony mixings. Turning to other topics, he mentioned that the evidence for the supposed vulcanization of a rubber sulphur solution at the ordinary temperature by ultraviolet light was unconvincing. In concluding, he expressed the view that what he had said was not only indicative of great activity in rubber chemistry, but would also indicate how wide are the gaps of knowledge which at present are bridged over by mere theories and need to be filled up with a solid mass of experimental evidence.

This paper was followed by one on "The Scientific Needs of the Rubber Industry," by B. D. Porritt, chemist to the North British Rubber Co., Limited. This paper was in the main a plea for the establishment of more laboratories in rubber works, it being pointed out that the industry required research laboratories as well as the routine laboratories which had sprung up since the advent of the much abused specification. While the laboratory might be accepted by some manufacturers as a valuable adjunct, it was as yet not recognized as an essential. The research laboratory he recognized would be only within the means of the largest works, but with the more general cooperation which might now reasonably be expected the results could be used to benefit the trade as a whole. A beginning had been made by the inclusion of some rubber manufacturers on an Advisory Research Committee of the Imperial Institute, but there was room for a much greater measure of commercial and scientific cooperation, this being a good time for this development because the abnormal trade conditions and national needs had for a while deadened trade competition and petty jealousies and had necessitated many conservative manufacturers abandoning the traditions of a lifetime. In the course of the interesting discussion which ensued, Dr. Twiss said that too much blame seemed to be laid on the manufacturers for neglecting research. The manufacturers were not out to benefit other people and had no sympathetic regard for the constitution of rubber, which seemed an unimportant matter from their point of view. A good deal of research had been done, but from mistaken motives the manufacturers had not allowed it to be published. A good deal of the research done in accelerators, for instance, had been crude and disconnected. Altogether there was a much greater excuse for the rubber industry not having raised its pure chemistry to

a higher stage than would appear at the first casual glance.

Dr. Stevens said that now was the time for the manufacturers, through their association, to make arrangements to start research. Mr. Sproxton said he thought that the sting of the paper had been drawn by the paper which went before, and the president of the society, Dr. C. C. Carpenter, agreed with this remark, the previous paper having told them that there were, at any rate, some manufacturers who were far seeing and who understood the value of scientific investigation and, what was more important still, allowed the results of these investigations to be brought to the notice of the industry generally.

BRITISH WAR ORDERS.

Proofers to the trade are now being kept busy by government orders for proofed shoe lining. Great quantities of tan duck are also being proofed to tan twill for government purposes such as valises, stretchers, bags of all kinds and hold-alls, besides cloth for gas-masks. The latter take a very long time in proofing, as a number of rubber coatings are necessary before the required specifications are attained. The government has also put out orders for covers for caps, bonnets, breech-loaders and Lewis guns.

Large quantities of rubber thigh boots have been secured by the War Office for winter use in the trenches. These were formerly obtained from Canada and the United States, as practically only one British firm could produce such boots, but now new firms have taken up their manufacture, and it is no longer necessary to depend on supplies from overseas.

BRITISH REQUISITION OF CARNAUBA WAX.

The Army Council intends to take possession of all stocks of carnauba wax, excepting stocks of less than two tons, that are at present or may arrive in the United Kingdom. All holders must, therefore, make full returns of their stocks, giving particulars of quantities, descriptions and cost prices to the Director of Army Contracts.

BRITISH INDIAN AUTOMOBILE CONCESSION WITHDRAWN.

In connection with the prohibition of the importation into British India of motor cars, motorcycles, and parts, it is learned that the Indian Government will withdraw the concession under which it was decided to admit, under license, cars, motorcycles and parts actually paid for before December 23, 1916, except in the case of cars shipped before August 1, 1917.

SUSPENSION OF THE KEW BULLETIN.

The announcement that this important journal is to be suspended under pressure of war economy and scarcity of printing materials, has roused a storm of protest. This organ not only serves to circulate the results of scientific activities at Kew, but also places at the disposal of the economic and scientific gardens in India and the colonies the latest facts in pure and economic botany that may be of importance to them.

THE EXCESS PROFITS DUTY AND PLANTATION RUBBER.

From the very outset the Rubber Growers' Association, London, England, has, under the best advice obtainable, taken vigorous measures to procure some amelioration of the hardship and inequalities to which many plantation rubber companies are subject under the Excess Profits Duty provisions of the British Finance Act of 1915, which imposes a uniform 10 per cent standard on the basis of capital. Particular attention has always been given to the interests of what have been termed "young producer" companies which are so heavily hit by a datum line based on the inadequate percentage standard allowed by the Board of Referees and figured on profits earned prior to the

outbreak of the war. Deputations have been heard by the Chancellor of the Exchequer and the Commercial Committee of the House of Commons, with the result that while the Finance Bill of 1917 as issued does not contain the general clause or amendments suggested by the Rubber Growers' Association, a provision is made to lessen after December 31, 1916, the hardship arising from the Vallambrosa judgment.

During the debate in the House of Commons the Chancellor of the Exchequer stated that while one industry could not be dealt with in a general tax in one particular way, the Treasury would not be opposed to a rehearing by the Board of Referees, and the Rubber Growers' Association has determined to continue the matter along that line. Meanwhile, as a result of representation on behalf of the association a new clause has been added to the bill by the Treasury sanctioning referring to the Board of Referees any application regarding a class of trade or business, and permitting closed cases to be reopened and orders revised if deemed advisable.

RUBBER FOOTWEAR IN NEW ZEALAND.

According to Consul General Alfred A. Winslow, at Auckland, New Zealand, the United States practically controls the New Zealand and market in gum boots, but there has been quite a falling off in the trade for 1916. The American gum boot is considered better than any other, unless it be the Canadian boot. The imports of gum boots for three years are here shown.

From—	1914.		1915.		1916.	
	Dozen pairs.	Value.	Dozen pairs.	Value.	Dozen pairs.	Value.
United Kingdom	223	\$11,247	100	\$5,270	56	\$3,582
Canada	360	11,688	309	8,755	285	8,730
Australia	14	743	24	1,732	3	200
United States	1,272	48,945	1,286	45,550	1,029	38,947
All other countries.....	19
Totals	1,869	\$72,642	1,719	\$61,307	1,373	\$51,459

In galoshes and overshoes of rubber, gymnasium shoes, etc., Great Britain sent the largest, Canada second, and United States the third largest amounts. American manufacturers do not seem to be holding their own in these lines, possibly because of the preferential import duty which favors the United Kingdom. The imports are as follows:

From	1914.		1915.		1916.	
	Dozen pairs.	Value.	Dozen pairs.	Value.	Dozen pairs.	Value.
United Kingdom	24,167	\$86,624	24,729	\$86,667	21,492	\$88,809
Canada	3,160	22,746	2,690	17,695	3,069	19,408
France	216	516	30	228
Sweden	71	326	283	1,120	113	389
Japan	18	29	116	418	736	2,151
United States	2,850	17,807	2,406	15,014	1,546	9,426
All other countries.....	100	418	10	39	80	146
Totals	30,582	\$128,466	30,264	\$121,181	27,036	\$120,329

A 1 per cent war tax is collected on all imports into New Zealand. Galoshes and overshoes of rubber, gymnasium shoes, etc., pay a duty of 22½ per cent from the United Kingdom and possessions and 11¼ per cent additional from all other countries, plus the war tax. Gum boots enter free of duty from all countries, with the exception of the war tax.

MOTOR CAR IMPORT LICENSES DISCONTINUED IN FRANCE.

A Ministerial Notice, published in the French "Journal Officiel" for July, is to the effect that no further licenses will be granted for the importation into France and Algeria of motor cars and motor lorries except in cases where it is proved that the vehicles were despatched direct to France or Algeria at a date prior to the publication of the notice.

RUBBER SPONGE IN TREPANNING.

For closing a hole in the skull Dr. C. Scandota, of Naples, uses rubber sponge. He reports to "La Riforma Medica" that he tried it on a rabbit and a dog, which he killed after nine and six months and found that except for slight loose adhesion to

the dura, the rubber sponge was unchanged. It had caused no trouble and the animals had behaved normally.

FRENCH WEST AFRICAN EXPORT DUTY.

The valuation of rubber exported from French West Africa from April 1 to October 1, 1917, has been fixed for the purpose of assessing export duty, at 500 francs per 100 kilograms [about \$100 per 220 pounds] for exports from Senegal, French Guinea, the Ivory Coast (including Assini), and Dahomey. Export duty is leviable at the rate of 7 per cent on the valuation.

COMPILATION OF RUBBER GOODS IMPORT STATISTICS IN HOLLAND.

In view of the possible resumption of the importation of rubber articles into Holland in the near future, The Netherlands Oversea Trust Co. has issued a request that those interested should send a written statement, mentioning countries of origin, of the quantities and weight of rubber articles, excepting tires, which they have imported directly during the last three years, whether for home consumption or reexport. In case of an increase in the imports, this was to be stated, as well as the reasons for such increase.

THE NETHERLANDS EXPORT COMPANY.

While war conditions disturb the normal exchange of goods between Holland and foreign countries, this company, recently formed at The Hague, will endeavor to provide for the exportation of Dutch wares, and promote the importation of articles of which there is scarcity in Holland. The activities of the company are controlled by the Minister of Agriculture, Industries and Commerce, who can order its liquidation when he considers that its existence is no longer necessary.

FOREIGN TRADE REPORTS.

AUSTRALIA.

ACCORDING to the latest statistics, Australia imported during the fiscal year ending June 30, 1916, rubber manufactures to the value of \$3,774,120, of which \$2,314,935 represented importations from the United States. These totals embrace tire rubber, rubber-tire fabric, tires, tubes, rubber stoppers or corks, rubber hose, bandages, elastic stockings, hatmakers' press bags and rings, gas bags, soles, pads and heels, and crash mats. India rubber, crude or powdered and reclaimed, rubber waste, and hard rubber in sheets were imported to the value of \$2,430,775, principally from Brazil, Ceylon, Straits Settlements, the United Kingdom, Peru, and Samoa; only \$42,380 was imported from the United States. Rubber thread, boot and apparel elastic, masticated rubber, syringes, and similar manufactures totaled \$186,050, the United States supplying \$17,140 worth. In the 10 months from June 30, 1916, to April 30, 1917, Australia imported india-rubber goods to the value of \$4,397,150, but the share of the United States is not given in the published returns now at hand.

SOUTH AFRICA.

During the past five years the imports of rubber goods into South Africa were: 1912, £42,191; 1913, £35,603; 1914, £34,083; 1915, £325,338; 1916, £520,145.

THE AZORES.

Imports of rubber goods, including tires, and automobiles, for 1916 show a marked increase over those for the previous year, the totals for the first-named articles being \$8,660 against \$849; while the figures for automobiles and their parts were \$9,586 in 1916 and \$7,852 in 1915.

The United States share in this trade was:

	1915.	1916.
Rubber goods and tires.....	\$260	\$1,709
Automobiles and parts.....	5,838	8,301
Totals	\$6,098	\$10,010

HOLLAND.

The rubber exports from Amsterdam to the United States during the past four years were \$382,430 in 1913, \$534,805 in 1914, \$98,960 in 1915, and \$164,689 during 1916. Automobile imports into Holland from this country during 1916 are said to have been the highest on record.

LONDON.

The exports of rubber from London to the United States during the six months ending June 30, 1917, amounted to \$34,611,850. For the same period in 1916 the value was \$24,556,033.

NEW ZEALAND.

The following table gives the imports of rubber footwear for the years 1914, 1915, and 1916 by country of origin, number of dozen pairs, and value:

	1914.		1915.		1916.	
	Dozen pairs.	Value.	Dozen pairs.	Value.	Dozen pairs.	Value.
Galoshes and overshoes of rubber, gymnasium shoes, etc:						
United Kingdom	24,167	\$86,624	24,729	\$86,667	21,492	\$88,809
Canada	3,160	22,746	2,690	17,695	3,069	19,408
France	216	516	30	228
Sweden	71	326	283	1,120	113	389
Japan	18	29	116	418	736	2,151
United States	2,850	17,807	2,406	15,014	1,546	9,426
All other countries.....	100	418	10	39	80	146

Australia	14	743	24	1,732	3	200
United States	1,272	48,945	1,286	45,550	1,029	38,947
All other countries.....	19
Totals	1,869	\$72,642	1,719	\$61,307	1,373	\$51,459

SPAIN.

A great demand exists in the Barcelona district for rubber heels and soles, about 10 tons having been imported during 1916. The sizes of such heels which are in greatest demand for women's shoes are those of medium dimensions, adapted to the Cuban heel. The whole heel for men's shoes is not generally used, its place being taken by the half heel, all sizes of which have an excellent sale. Rubber soles are difficult to obtain at present, but could be disposed of readily if more widely distributed. These articles pay a duty of \$0.32 per pound.

THE SITUATION IN RUSSIA.

By a Special Correspondent.

THE war and the revolution are working changes in the Russian peasant's conception of comfort and luxury and of what degree of each ought to fall to his share, that are as important—if less apparent—as his new attitude towards politics. He has been taken out of his tiny village, brought to large towns, made to work in factories, and, in any case, he now receives more money than he ever dreamt of possessing. He has learned that there are comforts, hygienic and sanitary, and is no longer satisfied with his village or town, where there are no tramways, lighting-systems, baths, etc. And his demand for all these and other things is going to cause the establishment of numerous factories and the placing of vastly increased foreign orders. Russia sees her backwardness and is striving mightily to advance. Conscious of her need of direction in this great effort, she turns to America for help with the cry voiced by one of her able men:

Teach us the a-b-c's of sane and wholesome work, make us efficient in our efforts, show us the results of well applied labors, and above all help us to erase that ancient self-verdict of the Russians which says: "Our land is vast and fruitful but there is no order in it."

America's growing interest in Russia is well known, and lately a circular was addressed to the different government departments in Russia to ascertain their attitude concerning the question of

the investment of foreign capital, and particularly American capital, in Russian enterprises. Furthermore, the Russian-American Chamber of Commerce is sending Professor B. E. Shatzky on a mission to the United States, to open a general information bureau for the distribution of data in connection with economic conditions in Russia.

It is interesting to learn that America's exports to Russia for 1916 were practically six times as great as in 1914, and nearly five times those of 1915.

Among the exports for 1916 may be noted.

Rubber belting, hose, etc.....	\$4,845
Automobile tires	1,125,733
Other tires	28,313
Miscellaneous rubber manufactures.....	20,416
Insulated wire and cables.....	13,915
Fountain pens	2,058
Total	\$1,195,280

The value of all kinds of motor vehicles imported from America was \$18,749,186. This includes airplanes, commercial and passenger automobiles and parts (except tires and engines) and motorcycles. The amounts for 1914 and 1915 were \$1,058,938 and \$9,456,089, respectively. The business in rubber manufactures during the same years was \$22,891 and \$12,616.

Russia also buys large quantities of cotton, Upland (including linters) and Sea Island. In 1916 the figures for Upland cotton and linters were 86,724,722 pounds, valued at \$10,125,462, and in 1915 41,062,654 pounds, valued at \$4,218,116.

THE DEMAND FOR CRUDE RUBBER.

The shortage of rubber is keenly felt in Russia and the demand is increasing continually. Negotiations, however, are hampered owing not only to shipping difficulties and freights, but also to the very great difference in exchange. Russia has always been a large consumer of rubber; before 1914 she imported 9,000 tons of raw rubber and gutta percha, and despite the war with its attending obstacles to trade, the imports were not diminished; in fact, they were increased in the case of rubber manufactures. And it is not likely that peace will lessen the demand for either the crude or manufactured article.

THE SITUATION IN MALAYA.

By a Special Correspondent.

RUBBER PRODUCTION.

THE total amount of rubber produced in the Malay Peninsula in 1916 falls just short of running into six figures, a development amazing in its rapidity, as is well illustrated by the following table:

Year.	Production in Malay Peninsula. Tons.	Year.	Production in Malay Peninsula. Tons.
1916.....	99,063	1910.....	6,504
1915.....	70,214	1909.....	3,340
1914.....	47,006	1908.....	1,629
1913.....	33,641	1907.....	885
1912.....	20,320	1906.....	430
1911.....	10,782		

This total output is derived from the following parts of the Peninsula:

	Production.		
	1914.	1915.	1916.
Selangor	14,015	19,120	26,163
Perak	11,042	16,663	23,421
Johore	5,358	9,167	14,004
Malacca	6,766	11,022	12,388
Negri Sembilan	5,278	8,177	12,179
Penang and Province Wellesley..	2,425	2,643	4,935
Kedah	1,030	1,889	3,314
Kelantan	307	536	1,010
Pahang	362	564	1,001
Singapore	423	433	628
Trengganu	20
Totals	47,006	70,214	99,063

The rapid increase of Johore rubber is striking. Another fact is that to-day's production of Singapore island alone exceeds that of the total Peninsula eleven years ago, and that Selangor and

Negri Sembilan together produce to-day more rubber than the whole of South America put together!

The total exports from Singapore in 1916 were 48,650 tons; in 1915 the amount was 38,283 tons, of which 12,824 tons went to Great Britain, 1,998 tons to European countries, 1,230 tons to Japan, and 21,075 tons to the United States. Exports from the Federated Malay States now constitute about half the world's output and were 62,763 tons in 1916 as compared with 44,524 tons in 1915.

The increase in direct sales to America is best illustrated by the following:

	1913.	1914.	1915.
Direct shipments tons	2,508	4,510	21,075

ACREAGE UNDER RUBBER.

Government figures available refer to estates over 100 acres in extent and show a grand total at the end of 1915 of 833,069 acres planted in rubber with a reserve of 917,185 acres.

Further grants of land have been made during the year, but the government of the Federated Malay States has since decided to discontinue the issue of land grants of more than 50 acres in extent, pending the return of labor, capital and administrative conditions to normal.

POSSIBLE RESTRICTION OF EXPORTS.

The prohibition of rubber exports from Ceylon is regarded with anxiety here, and it is feared that a similar prohibition will be applied to Malaya. There is a rumor that the exports to the United Kingdom are to be reduced to 2,000 tons monthly. In view of this condition, schemes for limiting the output—alternate day tapping or complete abandonment throughout the country of Sunday tapping—have been suggested. There are authorities, however, who consider that the position would hardly be as serious as it sounds if more rubber could be shipped direct to the United States via the Pacific Ocean. It is pointed out in this connection that America has become the greatest consumer of rubber, and that of the large quantities entering the country only 22 per cent came from Great Britain. An interesting question is whether America will have to pay more or less for the rubber. To some, the former appears probable, since a demand is here concerned that must be satisfied, while others point to the possibility of operators in Singapore taking advantage of the situation created by the restriction of imports to depress the local market, and suggest that the authorities should fix a minimum price or take some other means to protect the planter.

RUBBER SEED OIL EXPERIMENTS.

Experiments are being made in the Federated Malay States regarding the commercial possibilities of rubber seed oil. The establishment of local crushing plants is being considered, the oil to be shipped to Great Britain and the cake used as cattle food or manure.

One of the chief difficulties in establishing a local crushing industry is the fact that the crop season for rubber seed lasts only about two months. Tests are therefore being made to discover whether rubber seed can be preserved for any length of time.

THE F. M. S. AGRICULTURAL CONFERENCE.

AT the Federated Malay States Agricultural Conference, held at Kuala Lumpur late in April, several interesting papers on various departments of plantation practice were read by T. J. Cumming, E. W. King, W. R. Shelton Agar, R. M. Richards, W. N. C. Belgrave, A. P. Vesterdal, F. G. Spring and others. Further facts were developed by the discussion in which many planters participated.

RUBBER CULTIVATION AND DISEASES.

It was stated that before attempting manuring in the case of poor areas, working of the soil should be tried, especially with

plough and harrows. A loose topsoil was of vital importance and rubber trees responded very well to proper treatment in respect to cultivation. Tillage in circular plots around the trees was recommended in the case of previously planted areas, the best time for this being the wet season, as the abundant moisture could then be conserved for the dry season.

Experiments in manuring showed that lines did more harm than good. Kainit seemed to have no effect. The best result was obtained on blocks receiving bonemeal at the rate of 400 pounds to the acre; but the effect of the same quantity of superphosphate was not far behind. Satisfactory results were also obtained with basic slag.

In connection with thinning-out, pollarding was not recommended. Pollards yielded little latex, led to careless tapping and prevented adjacent trees from benefiting fully. The most satisfactory way was to cut out the tree about two feet below ground level, removing as many side roots as possible without interfering with adjacent trees. As to the method of thinning-out, it was held that with 20 by 20 planting, as a general rule, as soon as 90 per cent of the trees were tappable, the rest might be dispensed with right away. After that, as soon as the natural development of trees showed signs of being checked the number per acre should be reduced.

The usefulness of clean-clearing to prevent the spread of diseases was also emphasized. The best way of getting rid of timber was by "double felling," that was, to allow clearings to grow up again for a year after the first felling and then refell and burn off. To prevent the spread of diseases, trenching deep enough to sever lateral roots and wide enough to include all affected roots, was recommended. The best time for clean clearing was before planting, but as the expense of this was very great, smaller stumps and roots could be taken up, while the large stumps could be trenched.

VARIABILITY OF PLANTATION RUBBER.

B. J. Eaton read an important paper on "Preparation of Plantation Para Rubber With Special Reference to Future Considerations." The researches of the F. M. S. Agricultural Department, he said, showed that variable methods of preparation were responsible for variability of the product. According to him, the uniformity of fine hard Para was due to the length of time taken in preparation, averaging any variations in conditions. He pointed out that market demands made it impossible for estates to produce one uniform type of rubber, so uniformity could apply strictly to only one type of rubber. For the present at least, three or four grades must be made, including two first grades—Pale crêpe and No. 1 lower grade crêpe—consisting of lump, skimmings and picked scrap—and No. 2 lower grade crêpe of bar shavings and earth scrap.

In discussing the better grades, he considered the problem of continuing the production of Pale crêpe and Smoked sheet, or of substituting the so-called "Slab" rubber for Smoked sheet. His conclusions are given in detail on page 716 of this issue.

RUBBER IN THE BRITISH COLONIES.

Rubber as a crop in India is growing in prominence, especially in Burma and Madras. The exports of raw rubber from India in the year 1916 were 6,229,242 pounds, valued at £970,916, as compared with 4,840,640 pounds, valued at £756,994, in 1915. Of the exports in 1916, 3,847,125 pounds, valued at £643,718, were shipped to the United Kingdom.

The total value of rubber exported from Uganda during 1916 was £5,374 as against £3,159 in 1915. The crop suffers little from pests or diseases and promises to become of importance. In 1915-16 only 5,538 pounds of wild rubber were exported.

The export of rubber from Zanzibar is mainly derived from *Landolphia kirkii*, of which a considerable quantity grows wild in a forest in Pemba. 2,384 pounds, valued at £213, were exported in 1915. The cultivation of Ceara, which was taken up

by the government in 1907, was not successful and has been discontinued.

The output of wild rubber in Nyasaland has decreased steadily until it is now a negligible quantity. Cultivated rubber, on the other hand, is shown to be on the increase, 6,766 acres being under cultivation in 1915-16, as compared with 5,936 in the previous year. Exports of cultivated rubber from Nyasaland in 1915-16 were 46,002 pounds, valued at £3,801, as compared with 33,685 pounds in the previous year.

In Seychelles there are about 184,000 rubber trees planted out, and about half of this number have reached the tappable size.

The value of the exports of rubber from Nigeria in 1915 was £38,113, as compared with £38,854 in 1914. On two Para rubber estates in the Sapele district, 94,413 pounds of rubber were harvested.

From Ashanti 317 tons of rubber, valued at £20,135, were exported during 1915. The increase was due to a renewed demand in Europe, caused by the exceptional conditions prevailing. When these conditions cease this trade may be expected to die down again. The natives have shown little interest in planting out Para seedlings. There are two European agricultural companies in the Southern Province of Ashanti, which have planted out large areas of cocoa and rubber. The oldest Para trees are six years old, and most of the trees are now tappable. The *Funtumia* trees are described as a failure, as they appear to need at least twenty years before yielding commercially.

Rubber has been planted on several estates in the wet districts of Vitilevu and Vanualevu in Fiji. The cultivation commenced about nine years ago, and subsequent growth has been satisfactory as compared with other countries. The plants now in Fiji have stood the occasional storms well. Rubber was exported from Fiji in 1915 to the value of £3,464, as against £463 in the previous year. It is hoped that the export of this produce will increase.

The leaf disease of rubber has again visited some plantations in British Guiana. It is considered that until a uniform period of wintering of the trees is obtained, considerable trouble in this respect must be expected.

RUBBER TRADE IN COCHIN CHINA.

Figures for the years 1913, 1914, 1915 show an increase in the quantity of rubber exports, but a decrease in the imports. This is mainly due to the fact that a great part of the French population, using manufactured articles, has returned to France on account of the war.

The exportation of wild rubber, which used to be sent along the Mekong river from the forests of Laos and Cambodja, is no longer of any importance. On the other hand, plantation rubber exports have increased rapidly in the last few years. In 1908, 3 tons were shipped from Saigon, while in 1915, 357 tons were exported. The amount for the period January 1, 1916, to August 22, 1916, was 312 tons, as against 133 tons for the same period in 1915. Since January, 1915, the exportation of rubber to countries other than France has been prohibited. Exports for the years 1913, 1914, 1915 were valued at \$128,752, \$158,328 and \$315,075, respectively.

The decrease in some imports is illustrated by the following:

	1913.	1914.	1915.
Rubber goods	\$185,081	\$197,234	\$180,000
Automobiles	412,800	202,212	152,004
Cycles	218,178	204,878	104,703

Sheet rubber is imported from France, and the value increased from \$11,000 to \$40,000. Rubber articles come from France and Singapore and advanced from \$23,000 to \$38,000, but the values for tires and hose decreased from \$142,000 to \$86,000. Automobile, riskshaw and cycle tires are imported chiefly from France and England.

BOLIVIAN NOTES.

BOLIVIA is one of those countries whose economical situation has been seriously affected by the war. It was, in fact, due only to her great mineral wealth that she was able to support the difficult position at all. However, it would appear from trade statistics for the first four months of 1916 that conditions were improving.

Another important item is the export of rubber, which underwent a marked increase in 1915. The United States is Bolivia's best customer for rubber, having bought no less than 90 per cent of the whole quantity exported. The distribution of the rubber exports in 1914 and 1915 was as follows:

	1914.		1915.	
	Metric tons.	Value.	Metric tons.	Value.
United States	419	\$311,701	4,645
Great Britain	2,846	2,098,199	341
France	575	425,800	68
Germany	481	347,540	16
Belgium	157	115,978
Chile	7	12,931
Argentina	9
Spain	2
Totals	4,485	\$3,312,149	5,081

The total rubber exports in metric tons of 2,204.6 pounds, over a period of 10 years show a steady increase in production: 1906, 1,930; 1907, 1,831; 1908, 1,818; 1909, 3,052; 1910, 3,118; 1911, 3,646; 1912, 4,080; 1913, 5,143; 1914, 4,485; 1915, 5,081.

Among the 1915 imports from the United States may be noted: Automobiles, valued at 22,183 bolivianos (the normal value of a boliviano in United States currency is \$0.3893), and rubber manufactures amounting to 4,628 bolivianos. The total amounts for these two items were, 26,192 and 24,282 bolivianos respectively.

EXPORT TAXES ON RUBBER.

In accordance with the law of November 18, 1913, rubber exported from Bolivia is subjected to the following export taxes:

Article 1.—When the quotation for rubber is 25 to 36 pence the export tax shall be 2 per cent ad valorem. This tax shall be 4 per cent ad valorem when the quotation rises to 37 to 48 pence, and 6 per cent when the quotation is 49 pence or above.

Article 2.—The same rate of export taxes shall apply to rubber of inferior grades, with an allowance of 30 per cent off the quotation for fine rubber.

Article 3.—In cases where the export tax collected in custom-houses of foreign countries adjacent is lower than that imposed by Bolivia, the government shall have the right to lower the rate of the Bolivian tax. (This measure was adopted to prevent smuggling of the rubber across the border and the consequent loss of Bolivian revenues.)

Article 4.—For the purpose of this law the value of rubber exported from Bolivia shall be 70 per cent of the London quotations at the time of the exportation. The London quotations shall be certified to the Bolivian Government fortnightly by the Bolivian consul stationed in London.

The acquisition of rubber lands in Bolivia is subject to the law governing the public lands of Bolivia.

Bolivia has no sea coast, but the government is much interested in the development and extension of railway lines and has declared its intention to extend the La Paz-Yungas railway, thus securing an outlet to the Atlantic by way of the Amazon River and the Madeira-Mamore Railway. This is of special importance to rubber producers who will then have an easy connection with the railways that connect with the sea coast ports.

The President of Bolivia has been authorized to contract a loan of £1,000,000 for the construction of the Atocha-Tupiza line, the last link between La Paz and Buenos Aires, and the government is endeavoring to place this loan in the United States.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED JULY 17, 1917.

- N**O. 1,233,401. Hose-coupling. J. H. Reeve, Sherman, Calif.
 1,233,420. Laminated, cohesive, interwound fabric constructed in tubular and annular form. L. A. Subers, East Cleveland, Ohio.
 1,233,465. Demountable rim. A. H. Harris, Barberton, assignor to The Firestone Tire & Rubber Co., Akron—both in Ohio.
 1,233,478. Tire. I. B. Irons, Morgantown, W. Va.
 1,233,504. Shoe-heel. J. Plant, Douglas, Alaska.
 1,233,537. Massage device. J. E. Ahlman, Denver, Colo.
 1,233,660. Tire-rim tool. A. A. Friestedt, assignor to Friestedt Manufacturing Co.—both of Chicago, Ill.
 1,233,705. Wheel-rim. J. T. Ronald, Seattle, Wash.
 1,233,811. Menstrual bandage or catamenial sack. P. Roger, Milford, Mass.
 1,233,853. Pneumatic tire. J. Drummond, C. Spuhel, and F. Spuhel—all of Kansas City, Mo.
 1,234,004. Vehicle-tire. F. Funderburg, Huntington, Ind.
 1,234,075. Tire-armor. W. H. Opitz, Bedford, Ind.

ISSUED JULY 24, 1917.

- 1,234,118. Tire armor. M. V. Batcheller, Gowrie, Iowa.
 1,234,142. Pneumatic tire. F. S. Dickinson, New York City.

 1,235,876. Hose connection for fabric and rubber hose. H. Cave, Elizabeth, assignor to Davis Bournonville Co., Jersey City—both of N. J.
 1,235,877. Tire casing. T. P. Chrisomalis, New York City.
 1,235,878. Hose comprising an outer casing and an inner tube of smaller diameter free to expand to the wall of the casing. W. T. Cole, Newton, Conn., assignor to Fabric Fire Hose Co., a corporation of Conn.
 1,235,890. Case for hypodermic syringes comprising a rubber collar for gripping the hypodermic needle head. A. J. Gilbert, Eufaula, Ala.
 1,235,921. Hose supporter button. R. Parker, assignor to Parker, Stearns & Co.—both of Brooklyn, N. Y.
 1,235,963. Anchoring means for the cord body fabric of tires of the "cord" type. F. S. Dickinson, New York City.
 1,235,965. Vehicle wheel tire. F. Fisher, assignor of one-fourth to A. C. Immer, one-fourth to F. L. Reichert, and one-fourth to W. Selinger—all of Arcadia, Mo.
 1,236,036. Teat cup. C. O. Anderson, Lancaster, Pa.
 1,236,174. Rubber heel. E. J. Hooper, Stoughton, Mass.
 1,236,227. Armored tire structure. C. W. Stewart, Martinsburg, W. Va.
 1,236,251. Non-skid device. P. Balko and A. Kocovsky, Milwaukee, Wis.
 1,236,290. Toy ball comprising a whistle and a rattle, etc. C. O. Griffin, Newbern, N. C.
 1,236,301. Vehicle wheel rim. E. N. Hatcher, East Tallassee, Ala.
 1,236,304. Hand stamp comprising an inflatable hollow sphere. R. L. Howell, Rochester, N. Y.
 1,236,310. Automatic life preserver. W. F. Johnson, Riverside, Calif.
 1,236,312. Hose clamp. H. C. Jones, Allentown, N. J.
 1,236,365. Life saving belt. H. B. Rogers, London, England.

ISSUED AUGUST 14, 1917.

- 1,236,411. Tire valve and signal. W. F. Downs, Bay Shore, N. Y.
 1,236,412. Cushion tired wheel. E. F. Dremann, Cleveland, Ohio.
 1,236,490. Cushion tire. R. D. Shirey, Woodland, Pa.
 1,236,506. Tire shoe or casing. G. S. Van Voorhis, Boston, Mass.
 1,236,534. Reinforced air tube for pneumatic tires. J. W. Blodgett, Chicago, Ill.
 1,236,619. Stopper for water bags, bottles, and the like. M. T. Steele, Brooklyn, N. Y.
 1,236,671. Non-skid device. H. Carroll, Boone, Iowa.
 1,236,689. Rain coat. M. C. Doubles, Richmond, Va.
 1,236,821. An improvement in wheel tires. W. T. Carey, Cranston, R. I.
 1,236,924. Arch supporter. M. Golden, Boston, Mass.
 1,237,041. Air valve for pneumatic tires for bicycles or the like. E. A. Hilding, Lidköping, Sweden.
 1,237,155. Rubber tire. M. E. Baxter, Steubenville, Ohio.

THE UNITED KINGDOM.

ISSUED JUNE 27, 1917.

- 105,894. Rubber-surfaced paving blocks. G. Anderson and Leyland & Birmingham Rubber Co., Leyland, near Preston.
 105,940. Gutta percha filled joint-making washers. C. J. Beaver, Range-moor, Crescent Road, Hale, and E. A. Claremont, Broom Cottage, High Legh—both in Cheshire.
 105,955. Reservoir pen. A. Coats, Hayfield, Castlehead, Paisley.
 105,961. Auxiliary pneumatic vehicle springs formed of short lengths similar to pneumatic tires. L. D. Jones, 134 Vine street, Bridgeport, Connecticut, U. S. A.
 105,977. Pneumatic cushions for air craft. T. Sloper, Southgate, Devizes, Wiltshire.

ISSUED JULY 4, 1917.

- 106,038. Infants' soother. Hasting, Lang & Co. and H. W. Byrom, 1 Roman street, Church street, Manchester.
 106,068. Tourniquet comprising a rubber tube. J. T. Brierley, "Highfield," and Leyland & Birmingham Rubber Co., Golden Hill Works—both in Leyland, Lancashire.
 106,126. Wheel tire rims. F. W. Baker, 59 Hagley Road, and J. S. Foley, 17 Beale street—both in Stourbridge.
 106,134. Golf ball. W. Taylor, "Southlea," Elms Road, Knighton, Leicester.
 106,157. Anti-rattlers for doors, etc., consisting of studs of resilient material forced through countersunk holes in plates. Daimler Co. and A. E. Berriman, Daimler Works, Coventry.
 106,198. Sock suspender. A. J. Lister, Marlborough House, Clifton Road, Ilkley, Yorkshire.

ISSUED JULY 11, 1917.

- 106,278. Inhaling device. Dragerwerk, H. & B. Drager, 53 Moislinger Allee Lubeck, Germany.
 106,295. Rubber mud-shield for boot heels. A. E. MacDonald, "Pegli," St. John's Road, Golder's Green, London.
 106,321. Rubber-faced motorcycle driving belt. G. Warwick, 80 Cobham Road, Seven Kings, Essex, and A. P. Crouch, 106 Cannon street, London.

ISSUED JULY 18, 1917.

- 106,402. Valves. C. A. Iorns, 4750 Cook avenue, St. Louis, Missouri, U. S. A.
 106,476. Method of coupling fabric hose sections. N. B. Braley, 14 West Granite street, Butte, Montana, U. S. A.

- 106,496. A white bar between two blue bars all of equal width—rings, lamp connections, automobile bumpers, pump valves, spiral packings, sheet packings, piston packings, rubber belting, rubber hose reinforced with fabric, air brake hose, pipe tester rings, fuller balls, siphon valve washers, tank balls, rubber elbows, rubber washers, jar rings, tire relines, blow-out patches, inner tube patches, tire inner tubes and ties. United States Rubber Co., New Brunswick, N. J., and New York City.
- 106,511. Artificial hands with rubber finger tips. E. W. Higgs, 23 Brandreth Road, Balham, Surrey.
- 106,550. A white bar between two blue bars all of equal width—rubber boots, rubber and fabric boots, boots and shoes having fabric uppers and composition soles, rubber coats, overalls, leggings, hats, gloves, mittens, swimming vests, aprons, heels and soles. United States Rubber Co., New Brunswick, N. J., and New York City.
- 106,559. Crutch comprising a pneumatic tired wheel engaged by the arm rest. H. C. Sparrow, 123 Mallinson Road, Clapham Junction, London.

ISSUED JULY 15, 1917.

- 106,588. Girdle and brassiere having vertical elastic inserts down the back. B. Prince and H. Prince—both of 38 East One Hundred and Twenty-sixth street, New York City, U. S. A.
- 106,606. Electric incandescent lamp comprising rubber ring. C. Ammentorp, 23 St. Pederstraede, Copenhagen.
- 106,645. Aeronautics. W. B. Quick, "Belmont," Station Road, Wootton, Isle of Wight.
- 106,681. Kinematograph apparatus comprising rubber tubing. A. E. Widdicom, A. Bennett, and A. H. F. Perl—all of 60 Doughty street, London.
- 106,729. Bottle with rubber stopper. I. G. Warren, Glen Rosa, Cumberhills, Duffield, Derbyshire, and F. H. Rogers, Broad Sanctuary Chambers, Westminster.

THE DOMINION OF CANADA.

ISSUED APRIL 30, 1917.

- 176,156. Pneumatic tire. W. J. G. Rogers, Montreal, Quebec.
- 176,184. Life preserver. The National Life Preserver Co., assignee of O. A. Youngren—both of Sheridan, Wyoming, U. S. A.
- 176,206. Brake lining. E. E. Waite and Standard Woven Fabric Co., assignee of a half interest—both of Framingham, Massachusetts, U. S. A.
- 176,280. Pneumatic cushion heel. O. Mussinan, New York, New York, U. S. A.
- 176,311. Teat cup. H. Stewart, Galt, Ontario.
- 176,323. Tire applicator. J. Wyatt, Melita, Manitoba.
- 176,351. Reinforced air tube for tires. The Western Canadian Enterprises, Limited, Vancouver, assignee to T. H. B. Gaynor, Middle Park, Victoria, both in Australia.
- 176,405. Safety purse comprising an elastic support. F. W. De Blieux, Chicago, Illinois, U. S. A.
- 176,532. Rubber heel. F. Berenstein, Chelsea, Massachusetts, U. S. A.
- 176,597. Waterproof bag for rubbers. J. A. Aristide, Vaillancourt, Ottawa, Ontario.
- 176,604. Reservoir shaving brush. F. W. Zeidler, Jersey City, New Jersey, U. S. A.

THE FRENCH REPUBLIC.

PATENTS ISSUED (WITH DATES OF APPLICATION).

- 482,932 (September 20, 1916). Improvements in the manufacture of hard rubber receivers and similar articles. W. W. Weiting.
- 482,960 (September 23, 1916). Protective pneumatic tire for carriage wheels. U. Favretti.
- 482,963 (September 25, 1916). Improvements in pneumatic tires. J. H. Christian.
- 482,994 (September 26, 1916). Device for inflating life-belts. W. G. Brokan.
- 482,995 (September 26, 1916). Improvements in wheels and rims. F. A. Scott.
- 483,006 (September 27, 1916). Capsule for compressed or liquid gas serving to inflate life-belts and pneumatic tires, as well as for other purposes. W. G. Brokan.
- 483,059 (September 29, 1916). Crutches for the wounded. G. A. Valland.

TRADE-MARKS.**THE UNITED STATES.**

- 92,308. The words MML LELMAN sanitary clothing. A. Stein & Co., Chicago, Ill.
- 92,614. The word Ecco—rubber-covered electrical wires and cables. The Electric Cable Co., Bridgeport, Conn.

Review of the Crude Rubber Market.

Copyright 1917.

NEW YORK.

AUGUST is usually a quiet period in the crude rubber market and the month just passed has been no exception to the general rule. The large buyers have shown no interest whatever in the spot market and futures being firmly held at a premium above spot prices were therefore not attractive. A year ago in August the market reached its lowest level, with First latex spot at 56½ cents, and futures covering the ensuing year were freely sold at 55 cents and even less. The upward swing that commenced in September last carried both First latex spot and futures to 84 cents on December 7, 1916, when the market declined. The experience gained by the sellers of futures at the low values of a year ago doubtless explains the negative attitude of the producers at the present time.

Plantations have interested smaller manufacturers who have taken advantage of the comparatively cheap nearby rubber and bought freely during the month. Inquiries have been numerous for all positions up to the end of next year, but sellers refused to make concessions and prices have ruled firm with a tendency to advance. Spot prices are about 1 cent to 1½ cents lower than a month ago, First latex being quoted 65½ cents and Smoked sheet ribbed 64½ cents on August 28, with futures nominally 67 cents for Latex and 65½ cents for Ribs. Brazilian Paras have been firm and practically unchanged with the exception of Upriver fine that was forced to 70½ cents during the month. Stocks of Caucho ball are plentiful and cheap, but the demand has been small. Africans were practically neglected, with the interest centered on Accra flake and Rio Nunez ball, the latter selling at the unusual price of 65 cents. Centrals continue to be scarce at firm prices.

The bogey of overproduction is dispelled by E. L. Killick, a well-known English authority, who sums it up as follows: "According to Rickinson, the world's production of rubber during the past three years was under:

	Plantation.	Brazil.	Rest.	Totals.
1914	71,380	37,000	12,000	120,380
1915	107,867	37,220	13,615	158,702
1916	152,650	36,500	12,448	201,598

"For 1917 the same authority gives the following estimate:

	Plantation.	Brazil.	Rest.	Totals.
1917	192,000	37,000	13,000	242,000

"It will be seen that plantation rubber increased about 50 per cent in 1915 and 1916, while the increase in 1917 may be only 25 per cent. After this year the rate of increase will rapidly decline as the diminishing area of rubber comes into bearing and by 1921 the increase may be almost negligible. In the light of such greatly increased consumption it is significant that the average price of plantation rubber should have risen from 2s. 6d. in 1915 to 2s. 10¼d. in 1916, while for the expired portion of the current year the average is over 3s. The lesson of these figures is that during two years of enormously increased production there has been corresponding expansion of the world's consumption, and it is clear that if the demand continues to increase at the same rate there is likely to be, a few years hence, not a surplus but an actual shortage of rubber."

In view of the foregoing, the following official figures of United States crude rubber imports are interesting: For the fiscal year ended June 30, 1917, the United States imported 333,373,711 pounds of crude rubber, compared to 267,775,557 pounds in 1916, and 172,068,428 pounds in 1915.

LONDON.

The London market has lacked inspiration from American buyers and quiet conditions have prevailed with firm prices

that show little change during the month. On August 1, Standard crêpe spot was 29¼d. and Smoked sheet 29d. The same grades were quoted 31d. and 29¼d. on August 28. The sentiment is strong against selling futures, spot and nearby being the only positions that are really considered in this market at the present time. London and Liverpool imports for June were 7,390 tons compared with 6,700 tons for May. Reexports for June were 4,750 tons, against 6,093 tons for May.

SINGAPORE.

During the first part of August the market developed a firm tone, despite the rather dull sentiment that prevailed. A tendency to decline was noticed after the second week and the market eased off, closing with lower prices. At the auctions held July 27, August 3, 11, 18 and 24, the average prices realized were: First latex crêpe 53.8 cents, compared to 56.09 cents last month; Smoked sheet ribbed 53.88 cents, compared to 55.14 cents a month ago. The total amount sold was 2,335 tons against 1,628 for last month.

COMPARATIVE NEW YORK PRICES FOR AUGUST.

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York) advises as follows:

"The market for commercial paper has continued about the same through August as in July, the demand being spasmodic though rather better, and rates on the best rubber names 5@5 1/2 per cent, and those not so well known 6@6 1/2 per cent."

MARKET CABLE SERVICE FROM LONDON.

The following market report has been cabled from London:

	Standard Crépe.	Smoked sheets Rubber.	Market.
July 30	30d	29 1/4 d	Unsettled.
August 6	30d	29 1/4 d	Dull.
August 13	29 3/4 d	28 1/2 d	Nominal prices.
August 20	29 1/2 d	28 1/2 d	Irregular.
August 27	31 1/4 d	29 1/2 d	Quiet.

WEEKLY RUBBER REPORT.

GUTHRIE & CO., LIMITED, Singapore, report [July 19, 1917]:

The weekly rubber auction opened yesterday with rather a poor demand, there being very few buyers in the market, and prices for the leading grades show a slight decline as compared with last week. The top price for fine pale crépe was \$1 down at \$132 (paid for one lot only) and that for ribbed smoked sheet \$3 down at \$128. Of plain sheet, smoked and unsmoked, there was again very little on offer, and only a few lots were sold. For brown and dark crépes there was not much inquiry, and prices show a drop averaging about \$5 per picul. The quantity sold was 441 tons, out of a total of 742 tons cataloged.

The following was the course of values:

	In Singapore per Picul.*	Sterling Equivalent per Pound in London.	Equivalent per Pound in Cents.
Sheet, fine ribbed smoked....	\$122@128	2/ 6 1/2 @ 2/ 7 3/4	51.85@54.30
Sheet, good ribbed smoked....	112@121	2/ 4 @ 2/ 5 1/2	47.60@51.43
Sheet, plain smoked.....	104@117	2/ 2 1/2 @ 2/ 5 1/8	44.20@49.73
Sheet, ribbed unsmoked.....	113@115	2/ 4 1/4 @ 2/ 4 5/8	48.03@48.88
Sheet, plain unsmoked.....	112@...	2/ 4 @	47.60@...
Crépe, fine pale.....	128@132	2/ 7 3/4 @ 2/ 8 1/4	54.40@56.10
Crépe, good pale.....	116@125	2/ 4 7/8 @ 2/ 5 1/2	49.30@53.12
Crépe, fine brown.....	110@115	2/ 3 3/4 @ 2/ 4 5/8	46.75@48.88
Crépe, good brown.....	91@108	1/ 11 1/8 @ 2/ 3 1/8	38.68@45.90
Crépe, dark brown.....	75@101	1/ 8 1/2 @ 2/ 1 1/2	31.88@42.93
Crépe, bark.....	60@81	1/ 5 1/8 @ 1/ 9 1/2	25.51@34.43
Scrap, virgin and pressed....	55@90	1/ 4 @ 1/ 11 1/2	23.38@38.25
Scrap, loose.....	66@83	1/ 6 1/8 @ 1/ 9 1/2	28.05@35.28

* Picul = 133 1/3 pounds.

Quoted in S. S. dollars = 2/4 [56.7 cents].

STRAITS SETTLEMENTS RUBBER EXPORTS.

The export of plantation rubber from Straits Settlements ports in the month of June, as officially reported by cablegram from Singapore, amounted to 8,775 tons. Of this total, 482 tons were transshipments from adjacent countries. Appended are the comparative statistics for three years:

	1915.	1916.	1917.
January	2,576	4,443	3,562
February	2,741	3,359	6,495
March	2,477	4,481	8,299
April	1,978	4,219	6,103
May	3,588	3,274	6,282
June	2,249	3,836	8,775
Totals	15,609	23,612	39,516

The above figures include transshipments from various places in the neighborhood of the Straits Settlements, such as Borneo, Java, Sumatra and the Malay States other than the Federated Malay States.

India	131	678
Straits Settlements	28
Japan	40,288	155,189
Totals	27,404,411	24,734,684

Same period, 1915, 20,037,627 pounds; same period 1914, 16,088,110. The export figures of rubber, given in the above table for 1914, include the imports reexported. (These amount to 1,968,030, 1,669,729 pounds from the Straits, and 286,686 pounds from India.) To arrive at the total quantity of Ceylon rubber exported for that year deduct these imports from the total exports. The figures for 1916 and 1917 are for Ceylon rubber only.

THE MARKET FOR RUBBER SCRAP.

Copyright 1917.

NEW YORK.

QUIET and dull expresses the situation that has prevailed in the rubber scrap market for the month just passed. August is usually given to shut-downs for repairs, new installations and stock taking. However, there was quiet trading, traceable to war orders that are keeping some of the rubber mills busy at this time. While the volume of business transacted has not been large in the aggregate, there was sufficient interest to support the market, and prices, with few exceptions, are the same as quoted a month ago. With the passing of the vacation period and the setting in of cooler weather, a more active interest in rubber scrap will doubtless be felt, as the mills are looking forward to a large fall business. While the low price of crude rubber may have had a quieting effect on the market, the fact that reclaim is a different material and an important factor in compounding and will create a demand of its own.

BOOTS AND SHOES. The trading in this material has been spotty and confined to carload lots on contract orders. New business has been hampered by uncertainty as to values, since transactions actually consummated were insufficient to establish prices. Boots and shoes were nominally held around $9\frac{3}{8}$ to $9\frac{1}{2}$ cents delivered to the mills, and arctics have shown but little improvement since a month ago. Trimmed arctics were nominally quoted around $7\frac{1}{2}$ cents, and untrimmed at $6\frac{1}{2}$ cents. The undertone is firm and holders are quietly waiting the resumption of fall business, confident in higher prices.

TIRES. The interest in tires has been almost negligible, with white G. & G. tires the dullest of all. The difference between this grade and mixed auto tires is so small as not to warrant the expense of sorting G. & G. tires; in fact, some holders have for some time classified both grades as standard mixed auto tires. Prices have shown very little change, standard white G. & G. tires being quoted at $7\frac{1}{8}$ to $7\frac{1}{4}$ cents, and standard mixed auto tires at $6\frac{3}{4}$ to 7 cents. Solid tires have been fairly active, the principal interest being shown in the clean material. The standard grade was $7\frac{1}{4}$ cents, and clean truck tires were $7\frac{3}{8}$ cents.

INNER TUBES. There appears to be an unwillingness on the part of small dealers to sell No. 1 tubes at present prices, with the patches removed in accordance with the new classification. The demand has been quiet for all grades of tubes, and very little movement has been noticed in this material during the month. Prices are largely nominal, with No. 1 tubes quoted $25\frac{1}{2}$ cents, and both No. 2 and red tubes at $13\frac{1}{2}$ cents.

MECHANICALS. Garden hose has had a fairly good call in some quarters, but the other grades have been very dull and uninteresting. Prices have remained practically unchanged from the quotations published a month ago.

UNITED STATES STATISTICS. For the fiscal year ended July 30, 1917, the imports of rubber scrap were 20,517,328 pounds, value \$1,569,448, compared to 16,371,573 pounds, value \$1,271,903, in 1916. Exports for the fiscal year ended June 30, 1917, were 3,819,627 pounds, value \$420,740, compared to 3,904,715 pounds, value \$400,148, in 1916. During the fiscal year of 1917 the exports of reclaimed rubber were 4,938,991 pounds, value \$814,199, compared to 6,406,946 pounds, value \$871,262, in 1916.

LONDON AND LIVERPOOL STATISTICS. The imports of waste and reclaimed rubber for June were 109,700 pounds, value £2,142, compared with 143,600 pounds for May, value £3,103. Exports of waste and reclaimed rubber manufactures of the United Kingdom for June were 1,256,800 pounds, value £25,607, compared to 904,100 pounds, value £14,947, for May.

THE MARKET FOR COTTON AND OTHER FABRICS.

Copyright, 1917.

NEW YORK.

EARLY in August the tendency of the American cotton market was upward, due to the government's report indicating that the new crop conditions had not improved, as was generally expected. There was a pronounced sentiment, however, that the prospects were really better than indicated by the last official figures and that the new crop has really improved. The situation failed to stimulate buying to any great extent and prices held firm. On August 1 middling spot cotton was selling for 25.26 cents, with December contracts at 24.49 cents. As the month progressed the market became nervous and the sentiment bearish, but selling was restricted by the uncertain crop situation. During the last week of the month the market eased off as the result of a more optimistic view of the new crop prospects, and prices declined. On August 28 middling spot cotton was quoted 23.10 cents in a quiet market.

The new crop picking is well advanced and prospects of early marketing are good and new cotton offers are coming in from various sections of the cotton belt.

The total new crop is estimated around 14,000,000 bales, compared to last year's world's consumption of 14,054,000 bales. There are many uncertainties, however, that may reduce the final outcome, such as frost and storms; and, moreover, the crop is capable of further improvement, so that the ultimate yield is still a speculative matter.

EGYPTIAN COTTON. The situation appears to be unchanged and while supplies are confidently expected the actual relief is not yet in sight. The Alexandria Cotton Co., Limited, reports the following new Egyptian cotton crop conditions: "Temperature has been constantly below normal and these conditions are unfavorable to a quick maturity. Last year we had at the same period continuous excessive heat which did much harm to the formation of the first picking bolls; this year the excessive cool-

ness will delay the formation of the first picking bolls and as a consequence they will suffer more from the pink boll worm attacks. In the northern districts considerable progress is to be noticed in the growth of the crop, but the original delay has not yet been recovered. The cotton leaf worm attack is now dying out everywhere. In general, the damage is less than last year. With regard to the pink boll worm, a sample of 100 bolls in Behera showed on examination, 16 bolls attacked by worms, and another sample from Menafia gave 25 per cent."

SEA ISLAND COTTON. The southern markets will open early in September and active demand is expected for all grades of this staple at high prices. However, the U. S. Census Bureau reports 41,149 bales of Sea Island cotton at the mills and 23,405 bales in warehouse, making a total of 64,554 bales unconsumed on June 30, that may prevent early buying at high prices. Increase in acreage is reported in the entire belt and crop conditions as a whole are promising despite the apprehension felt in some districts where the boll-weevil has already appeared. Should favorable weather conditions prevail and the pests be controlled, a final crop of 125,000 bales may be expected.

AIRPLANE AND GAS MASK FABRICS. The demand has been unusually active and prices unchanged, with the exception of Wamsutta No. 4, 38½ inch, that is now 42½ cents. A special grade of this fabric used for gas masks has been very active and is quoted at 44 cents.

MECHANICAL DUCKS. Hose and belting ducks continue to be insistently called for from both civilian and government sources. Prices are firm and unchanged, with a tendency to advance.

RAINCOAT FABRICS. Some large sales of 64 by 60 inch, olive-drab bombazines for government contracts have been reported. Manufacturers are confidently hoping to secure additional contracts for supplying the new slickers prescribed by the government. The demand has been good for small plaids printed in sport colors, as outside fabrics for women's coats and children's capes. These are surface prints on a 64 by 60 inch cloth and have the appearance of a high-priced woven fabric.

SHEETINGS, OSNABURGS, DRILLS. Government orders are responsible for the firm condition of these fabrics. Sheetings and Osnaburgs have been very active and prices for certain grades have advanced. Carriage cloth duck is very scarce and prices are firmly quoted, showing an upward revision since our last report. Drills have had an active demand, with the result that stocks are very low and prices are firm and unchanged.

TIRE FABRICS. The tire fabric market is still harassed by the uncertainty attending the new crops of Egyptian and Sea Island cotton. Standard 17¼-ounce Egyptian and Sea Island building fabrics have been greatly restricted by the prevailing conditions and are not quoted by some manufacturers. Present quotations are considered to be largely nominal. Standard 17¼-ounce peeler building fabrics have been in active demand, with an advancing price tendency.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

Copyright 1917.

NEW YORK.

THE metal market has been characterized during the month by a generally dull and stagnant condition, wholly due to the uncertainties pending the government's price-fixing decision. The demand for lead has been practically nil and prices nominal. The government has purchased 8,000 tons at 8 cents, St. Louis, to cover its August requirements. If the government orders are sufficient in volume to absorb surplus production, the market will continue to be firm. Should the government use 8,000 tons monthly, about one-fourth of the yearly production would be thus required.

Trading in spelter has been confined to small lots for immediate requirements, the volume of business, however, being too small to establish market prices. The government has bought 11,500,000 pounds of spelter at prices reported to range from 8.75 to 9 cents. Antimony was dull, with the demand at about zero. Price changes have been small during the month, Japanese and Chinese grades being quoted 15 to 15.50 cents New York, duty paid. The aluminum market has been colorless and prices show no change. No. 1, virgin metal, 98 to 99 per cent pure, is nominally quoted 50 cents, New York.

Business in rubber chemicals during August was fairly active for this time of the year, when the demand is usually quiet. Contract deliveries have been regularly made and inquiries for future requirements show anticipation of good fall and winter prospects in the rubber trade. Toward the latter part of the month the midsummer influence was made apparent by the diminution of business, and the market became easier. The uncertainty and firmness in the base metal market were reflected in the lead and zinc products of all sorts, resulting in a strong market position for these materials. Manufacturers of chemicals and ingredients are carefully scanning their production costs and awaiting the government's decision on the raw material price question. Until this matter is definitely settled uncertainty will dominate the market for lead and zinc products used in rubber compounds.

ACETONE. Stocks are very scarce and the production is well sold up, due to an active demand from both foreign and domestic sources. Prices are nominal, ranging from 33 to 35 cents a pound.

ANILINE OIL. The call has been steady and the producers appear to be able to meet present requirements. Prices are quoted on a basis of 28 to 29 cents.

CARBON GAS BLACK. The production cost continues to be high and prices are firm. There are practically no spot stocks, and sellers are only able to secure sufficient supplies to cover contract deliveries.

CAUSTIC SODA. The demand has exceeded the supply and there is a pronounced scarcity of available stocks. Leading producers are out of the market, which is now controlled by second hands. Prices have advanced since last month to 9 and 9 1/4 cents a pound for 76-78 per cent caustic soda.

HEXAMETHYLENE TETRAMINE. This organic accelerator has advanced in price and is now quoted 80 cents a pound.

RECLAIMED RUBBER. This material has been in active demand, and consequently prices are firm and show a slight advance during the month. Standard shoe reclaim was quoted at 16 1/8 to 16 3/4 cents, and standard tire reclaim, 21 1/4 to 21 1/2 cents on August 27.

SULPHUR. Difficulties in shipping the raw material continue to restrict this market. Prices are firm and unchanged. The Export Council at Washington has discredited the report that an embargo has been placed on exports of sulphur to Canada.

TOLUOL. There are no supplies available as the government is taking over the entire production for making trinitrotoluol, one of the most valuable high explosives.

WHITING. Business has been good and the consumption of both whiting and chalk is far in excess of the supply. Prices are firm and unchanged.

ZINC OXIDE. Active demand for this material has been the feature of last month's chemical market. It is of interest to consumers to know that the time is approaching for a new schedule of prices for French process zinc oxide.
